ON BUSINESS **BANK AGENT**

Cornwall,

Dear Sirs,
During 3,000 miles riding in the past rough winter on regular business trips through this county, I have relied on the little bike like a train. I have never been late for appointments, and am glad to say good things of the DOUGLAS.

Signed,

WOLF

It may be of interest to readers to know the following extract from a letter received this morning from our agent at Burt.n-on-Trent.

"Result of Whit Monday's Reliability Trial. The best performance of the day on Formula was the 'Wolf' 2-stroke ridden by my son. The only machine to negotiate all the test hills on Top Gear. Beating a field of 21. The machine ran consistently throughout."

The Scottish Six Days Trial.

JUST as the T.T. is the most searching test for solo machines, the Six Days Trials organised by the Edinburgh M.C. and the A.C.U. serve a similar useful purpose in developing the passenger machine. The first of these starts next Monday, and traverses approximately a thousand miles of roads, rather stiffer than those which the average motor cyclist expects to cover in a Scottish tour.

The value of such trials is enhanced by the fact that in this country we have no event which tests reliability and durability of the sidecar machine as a parallel to the Tourist Trophy race for solo motor cycles. The experience gained by manufacturers who compete in such trials, therefore, provides data which enable them to eliminate weaknesses which otherwise might be left for the private owner to discover.

One reason for the success of the Scottish event and its value to the motor cycle movement is the fact that the trial is run as a strenuous tour under conditions such as the private owner experiences, and the final awards are not made on the results of more or less technical tests. For example, there is no need for a special brake test in the Scottish Six Days, for the very good reason that no machine could obtain an award which was not adequately equipped.

Larger Tyres.

THERE are very many riders who sigh for increased comfort on our post-war roads. Most of these are men who have passed their first youth, and are prepared to sacrifice a mile or two an hour for a little extra luxury. Yet in many cases they are inclined to be shy of spring frames.

A good spring frame is undoubtedly the best solution of the comfort question, and there is no reason to fear trouble from the more reputable makes, but there are still only a few spring frame solo machines on the market. Under the circumstances quite the best compromise is the fitting of larger tyres. Without personal experience few will believe what an enormous difference can be obtained by the use of tyres of larger section. The difference between tyres of 2⅜in. and 2½in. sections is very perceptible, and a change from 2½in. to 3in. sections makes all the difference between physical discomfort and comparative luxury on pot-holey roads. The larger tyre can, of course, be run somewhat less fully inflated than the smaller size, and, provided a suitable tyre is selected, there will be no noticeable roll. Heavier tyres also give comparative immunity from small punctures, and provide a sense of security which must be experienced to be understood.

Prices.

WHILE the present tendency is for manufacturers' prices to continue to rise, supply now appears to be catching up with demand in the second-hand market. One has only to watch the miscellaneous advertisements to appreciate this, for "slightly soiled" machines offered a few weeks ago at a premium, are now quoted lower than catalogue prices.

It is highly desirable that prices are governed entirely by cost of production, and not on the principle that the value of an article is what it will fetch. In the pedal cycle world the demand has fallen off very considerably since the last advances, and this state of affairs may find an echo in the demand for lightweight motor cycles, and so on, through the range of motor-propelled vehicles to the highest priced car. Manufacturers must bear in mind that, keen as motor cyclists have shown themselves to be, the maximum limit is not fixed by inclination but by the financial position of the buyer. With the increase in cost of living which has to be met by the middle class—the section of the public which purchases the bulk of machines—there are many pre-war motor cyclists who cannot afford to ride during this difficult transition period.

An Index to the advertisements in this issue will be found on the page facing the back cover.

Reversing the T.T. Course.

SOME wag in the Isle of Man started a rumour that the race was to be run over the same course next year, but in the opposite direction. This notion fairly put the wind up several intending competitors. The present "direction of rotation" is obviously determined by the mountain road. On the Ramsey side of Snaefell there are at least three corners which would be murderous if taken downhill instead of up. At any of them any serious brake trouble or miscalculation of speed would spell certain death. It may be taken for granted that the direction of the race over the existing course cannot be changed. Whether the course is suitable for a full entry of crack riders on racing machines of 1921 calibre is another question. It speaks well both for the skill of the riders and the design of their mounts that no fatalities occurred this year.

Scott Merchants in the Island.

I ENJOYED much pleasant *badinage* with the sundry Scott enthusiasts in Manxland. The factory people have christened me "the enemy" as the result of my frank criticism of the one or two details which alone are open to comment in this delightful mount. I came away in a very chastened mood, feeling that I have much to learn about timing two-strokes. Would you believe that Tim Wood's standard touring 'bus can actually beat 60 m.p.h.? And that Capt. Vintner's engine starts from stone-cold in the second kick? Wood gets his cold start in a way that is new to me. He engages a gear, and pushes the machine to and fro for a yard or so whilst flooding the carburetter, after which it responds to the first kick, or at any rate to the second. Capt. Vintner says that the engine does about five extra miles on a gallon if the plugs are put in the heads of the cylinder. All Scott users seem to agree that it takes 2,000 or 3,000 miles to work a Scott up to the absolute zenith of its running, in contradistinction to certain softer engines which age rapidly. When I get mine to do its mile a minute, I shall be ready to die in peace; but just at present I am stuck at the 45 m.p.h. mark or thereabouts. Incidentally, I hear that A. A. Scott is still busy with the Scott Sociable; it has no commercial connection with the Scott bicycles, but is by no means dead, and may ultimately make its *début* at quite an attractive figure.

Wolverhampton on Top!

IT used to be said that Coventry would always be the hub of the motor industry, because no other district could furnish the necessary supply of skilled labour. I always retorted that if this prophecy were true, Coventry would end by being bigger than London, for no one city could contain the automobile industry. Already the needed quality of labour is available in many other centres. Some of it has migrated, and some of it has been trained from the raw. Munition requirements accelerated the distribution and multiplied the supply. Coventry is quite losing caste, and in this year's T.T. Wolverhampton was completely on top, with Birmingham a good second. The Triumph and Rudge will have to go all out next year to win back lost prestige for the three spires. Just at present municipal rates on factory plant are so heavy that the tendency is towards building big engineering factories outside urban boundaries. One Scottish firm has isolated a big works miles from anywhere on the banks of a salmon river big enough to furnish cheap power. Two steamer tips for the 1921 T.T.—offered on the voyage home—were Saltaire and Surbiton. Some of this year's abstainers are talking very big about the money they mean to spend on winning next year; but, then, the air of the Island and the atmosphere of the race are both intoxicants. When these aspirants discuss the question in their boardrooms somewhere in a murky town, their tails may get comparatively flabby.

Post-war Material.

A GOOD many grumbles are audible about the quality of some of the stuff which is being put into some post-war machines, but I can only counsel users to be patient, and to make the best of things until conditions return to the normal. The T.T. has proved that manufacturers cannot help themselves, for every conceivable precaution is taken when a trade concern spends thousands of pounds on a critical occasion, and yet things broke. No firm can test every bit of stuff which it uses; if you find that one end of a sample bar is O.K., the other end may be dud. Moreover, it is such a job to get raw material in sufficient quantities, and riders are so clamorous for deliveries, that inspection cannot be maintained at the old standard. Under such conditions we must console ourselves by noting that cases of serious dissatisfaction are few and far between, and that manufacturers generally meet them with real promptness and honesty.

A Legging Suggestion.

I AM not tickled to death with Mr. Graham's stunt of using an old stocking to keep his trou-trous clean when taking off legging overalls. The cutest fitting at the last car Olympia was a lightning metallic seam for side curtains shown on the Auster stand and fitted to a demonstration Rolls-Royce. I have forgotten the inventor's name, but I struck the seam the other day on the toolbag of a friend's 10 h.p. Singer car, so the gadget is evidently being pushed. I suggest this patent seam is immensely applicable to motor cycling leggings. Its operation is simplicity itself. At one end of the seam is a metal tab; a tug on the tab rips the seam open from end to end, just

Occasional Comments.—

like the ripcord of a balloon. A reverse pull on the tab stitches the seam up again. If this gadget were applied to our leggings, we could shed them without threading our feet through the legs at all, and we could then wear golf or cricket shoes with nails in them. I hope this will catch the inventor's eye.

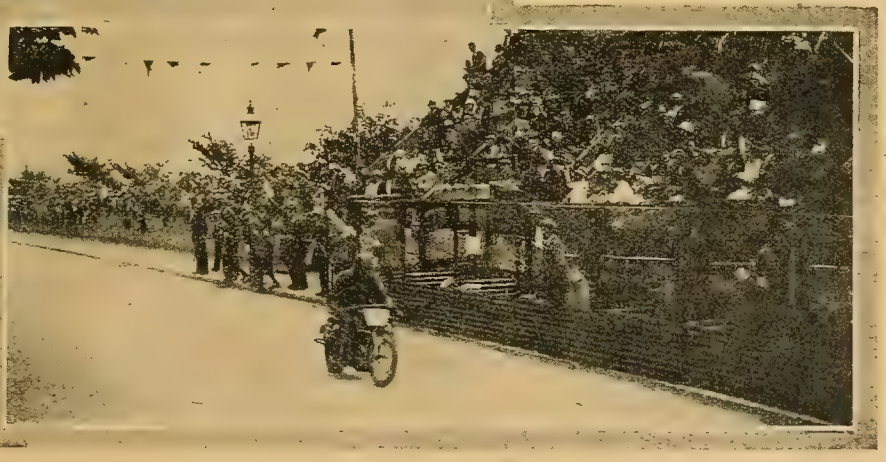
Mudshields.

A LOCAL rider who has been impressed by the mudguarding of my Scott and A.B.C. machines has been moved to fit a leather mudshield to his 1915 mount, in order that he, too, may ride in trousers, and visit his lady-love without pausing outside the paternal gate to rub down his boots with a wisp of grass or a bunch of dock-leaves. He now remarks that there is more in this complete mudguarding than meets the eye. True, his boots and trousers benefit exceedingly, but his engine, which, in its former nude condition, used to chug away merrily up single-figure gradients with a sidecar full of femininity, now smells like a traction engine when it is asked to tackle 1 in 10 solo. I am afraid it is a fact that some pre-war engines distort under heat, and that their cooling safety margin is too narrow for them to bear any interference with the draught. The draught windows in the mudshield of the new A.B.C. are fitted with little slides which can be closed at will. I suppose the idea is that they should be shut when one is fording rivers or charging water-splashes? Anyhow, the cooling is so good that one can tour with the slides shut, for I have tried it.

Saluting Ladies from the Saddle.

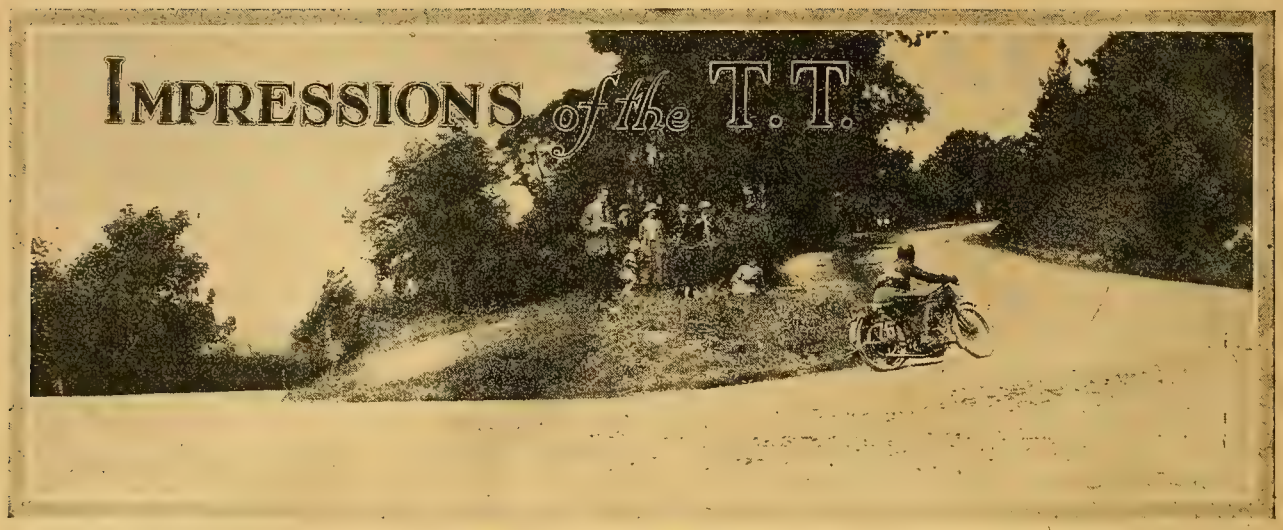
I FANCY a Mumbles correspondent must be trying to pull my elderly and innocent leg. He complains that etiquette compels him to doff his cap to lady acquaintances when he is motor cycling. He finds the custom expensive, because his hands are generally oily, and he is a bit of a dandy where his headgear is concerned. Moreover, it is dangerous, as a wobble may develop when the hand is removed from the bar. Finally, a sportive wind may whisk the cap out of his hand and waft it over the cliffs. He wishes to ascertain my personal practice.

I never experience any such difficulty. Not the least merit of the motor cycle is that it provides a plausible excuse for cutting undesirable people without their knowing that you are deliberately avoiding them. I fear my tailor, for instance, more than ever I feared a machine gun; but if I am in the saddle when I meet him, I fix a distant eye on an imaginary old lady who is blocking the fairway 100 yards ahead, and hoot vigorously. The good man can thus proceed on his walk with pleasant dreams of the cheque which I have no intention of writing. The girl who has jilted you—on sighting her, you assume a grin of glee, crouch down, and scrap deliriously, abandoning her to the torturing suspicion that you never really loved her. The girl you have jilted—you cast her a very respectful and reproachful glance which comforts her without giving her the chance of demanding an awkward explanation or attempting an unwanted reconciliation. Mother-in-law—well, ram her in the region of the bustle. Where more ordinary politeness is genuinely desired, my Mumbles correspondent should try a plain service salute, which may be of the guards, naval, or R.A.F. model where special punctiliousness is desirable. As a matter of fact, many ex-service men are substituting a pseudo-military salute for the old convention of lifting the hat; it has claims on pedestrians, especially if their tresses are of the unruly variety. Anyway it gives the impression that one once served with the forces.



THE 1920 T.T.

Immediately below the grandstand were the replenishing depôts, bearing the numbers of the competing machines. It was interesting to observe the difference in the speed of despatch of the various riders. Some were there for seconds only, and others replenished in quite a leisurely manner. R. O. Clark (Levis), winner of *The Motor Cycle* Trophy, is seen in the lower photograph



Some Reflections on the Isle of Man Races and the Men and Machines which competed in them.

By B. H. DAVIES.

HOWEVER vivid one's interest in the technical aspects of motor cycling may be, the dominating impression of the T.T. is admiration for the riders. The preliminary weeks of brainy toil; the emotional exhaustion of anticipation of the actual race, and of final disappointment (for most of them); their splendid pluck; their phenomenal riding skill; their cheery sportsmanship when defeat comes—all these are the raw material which provides us with a thrilling spectacle and many invaluable technical data.

I go so far as to think we are now taking too much advantage of the willing sportsmanship of the racing boys. Let those who saw the 1920 Senior Race picture a similar event in 1921, contested by an entry of over 100 machines, most of them hot-stuffed by the concentrated efforts of the best British and American factories. There may well be in next year's race a dozen trade teams as cleverly and carefully readied as this year's Sunbeams. There may even be three or four fliers of Dance's class at the head of the entry. Can such an event be run off without killing a few men? Would not victory depend too much on the man and too little on the machine? Should we either take means to limit the pace, or preferably seek a venue where the engine can be run all out for long periods, and where less hinges on a jockey's ability to sidestep death round a corner fifty times in each hour that the race lasts? These are serious questions which the A.C.U. will have to weigh.

Marked progress was evident in design. So far as engines are concerned, it was most notable that the Norton engine—practically standard in every detail, and wholly standard in its general outlines—could not only stand the racket better than any other in the race, but also came uncommonly near absolute victory. This is a gigantic feather in the Norton cap. Sunbeams—the only premier firm with a really special engine in the Senior race—showed that the best standard engine does not give quite so much power as the best specials, and that the latter can be made quite as reliable; for I put down Dance's broken inlet to pure hard luck.

SPORTING AGENTS IN THE "T.T."

T. Sumister, of Macclesfield.

V. E. Horsman, a Liverpool agent.

Jack Thomas, of Neath.

Harold Petty, another agent, of Leicester.

The agent who rides the machines he sells is always on a better footing with his *clientele* than those who merely buy and sell. In 1920 there were quite a large proportion of agent riders. Among these may be mentioned—V. Horsman and O. Wade, of Liverpool; Harold Petty, Leicester; T. Sumister, Macclesfield; Jack Thomas, Neath; J. W. Shaw, Belfast; Eric Williams, Worcester; Cyril Williams, Wolverhampton; A. H. and D. S. Alexander, of Glasgow and Edinburgh; P. Pike, Exeter; Bert Houlding, Preston; R. O. Clark, Norwich; and F. W. Dixon, Middlesbrough. The four riders depicted above all rode Nortons.

Impressions of the T.T.—

I doubt if special hot-stuff engines—or, indeed, 'buses—have ever shown such magnificent reliability and stamina as these 1920 Sunbeams exhibit; and I beg to plead for a lightweight sporting single-cylinder with an engine of this class.

The A.J.S. machines just failed to parallel the Sunbeam feat. In speed and power they probably represented a still more signal advance on past practice. Anyone who saw a 2¾ h.p. A.J.S. in either race would judge by its performance that it was a 500 c.c., a 1920 500 c.c., and an uncommonly good sample at that. But since the A.J.S. people no longer make singles for sale, they not unnaturally failed to get their racers dead right in time, and so they only won the Junior by the skin of their teeth. If they go for it next year, it may be a gift for them; for there is precious little the matter with their 1920 'bus, and they know its weaknesses.

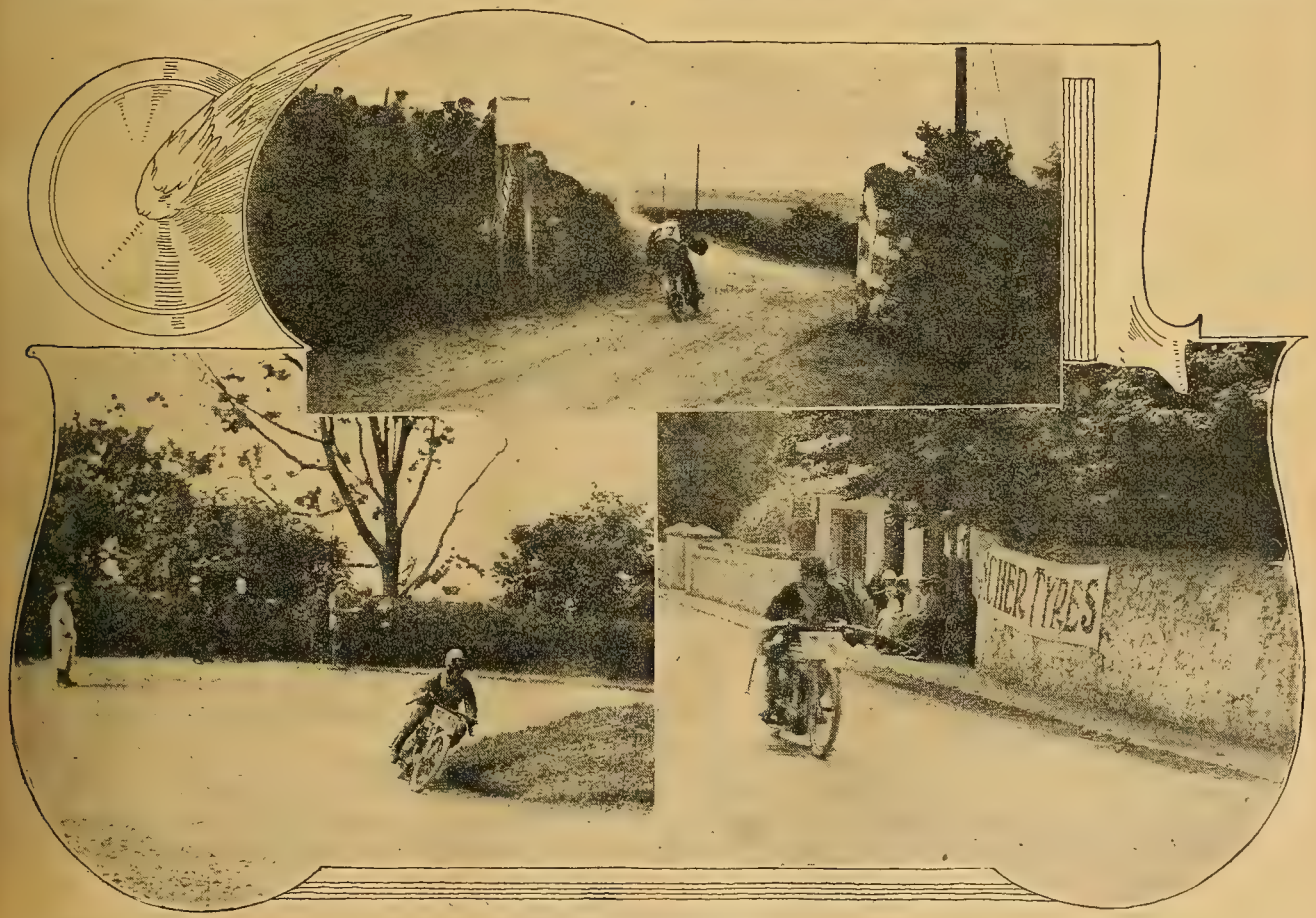
F. C. Townshend, a Sunbeam staff rider, whose fastest lap was 44m. 58s.

Noel Brown (Norton), one of four Liverpool enthusiasts who rode in this year's T.T.

The big fellows naturally overshadowed the little ones. But perhaps the most astounding performance of the whole week was that of the Levis. Remember that nothing but sheer hard luck prevented Clark from winning the Junior outright. Then reflect that 35 m.p.h. is about the limit of the average 250 c.c. two-stroke, and that it eats sparking plugs if you over-drive it. Give the public baby two-strokes akin to the racing Levis, and it will be safe to assume that the demand for big solo mounts will decline. We need efficient lightweight machines more than we need anything else.

The Blackburne performance is first cousin once removed to the Norton feat. It just could not win unless a lot of faster machines fell out; but it showed how exceedingly good the standard Blackburne engine is.

Transmission proved one of the most interesting details in both races. Faulty drives outed the Douglas in the Senior, and several A.J.S. machines in the



T.T. REMINISCENCES.

N. W. Loughton (Douglas) passing Keppel Gate on the mountain road in the Junior race. (Left) Norman Black (Norton), who finished eleventh, cutting it close at the Ramsey hairpin. (Right) Capt. A. Lindsay (Norton) at speed through Crosby.

Impressions of the T.T.—

Junior. Here is a point which deserves emphasis. The machines which used their standard transmission experienced no trouble with it. I am wholly against the admission of such freak drives as Alexander's six-speed Douglas (two engine chains with a three-speed countershaft box) and the A.J.S. (two engine chains with a two-speed countershaft box).

I do not believe these freak gadgets were of any real help to their users. Mr. Stevens probably wishes he had fitted a standard box, and the six-speed Douglas was not faster than several three-speed machines. My point is that these three-chain drives will never pass into ordinary use, and I would as soon see the race won with a steam engine.

If four speeds or six speeds are desirable for touring, let us have them in the race: but have them in the A.B.C. or Rudge stock patterns. The belt is clearly doomed, so far as heavy machines are concerned; nor do I fancy that gear changes of the "square gate" pattern will win against the "long gate" type. You cannot cross a broad gate with safety whilst you are cornering at speed.

Only two machines really "conked" on hills in either race. One was grossly overgeared, and the other had a standard pre-war engine. Compare these facts with the "overheating" of which the A.C.U. complained so vehemently in their last Six Days Trial. It is clear that, when the trade likes, it can turn out engines which neither "dry up" nor "conk." Let the few firms which are still careless about such matters on their standard engines feel the draught of a sturdy boycott by private purchasers; and "conking" will pass out of the motor cycling vocabulary.

Steering Design.

At least one firm learnt something about steering design in the race. If the T.T. is ever held on a flatter, straighter course, which compels would-be winners to hold 80 m.p.h. continuously for five miles, the steering of motor cycles would receive much attention.

Another set of incidents in the race suggests a research job for the A.C.U. It provided numerous brake tests of a genuine character, wholly distinct from the playful pretences which pass under the same name in reliability trials. Two special points of keen interest arose. One was the fact that certain brakes were very liable to jam in the "on" position. (I might add that the brakes of sundry touring machines are equally prone to become permanently "off," but before a race such dangerous designs are faked into safety by their riders.) Two or three men narrowly escaped violent deaths from this fault. Another was outed by a brake control, which is not positively located. The customers of the firms concerned will shortly benefit by these little incidents—a sufficient answer to the cynics who fancy that racing does no good.

Far more interesting was the demonstrated inefficiency of one system, which applies all the braking power on the rear wheel. The men who used brakes on both wheels could stop more quickly and more safely. We must admit that many existing front wheel brakes are tiresome, inefficient, and even dangerous. The racing unquestionably proved that a properly designed two-wheel braking system is better than a single wheel system. When some of the absentee firms begin to design for a win at 55 m.p.h. in 1921, they will have to re-design their brakes; and if they do not do it they will not win. George Dance could not do a lap in 40m. 13s. if his engine were installed in certain bicycles of my acquaintance. This matter is parallel to the new interest in braking all four wheels which some Continental designers of racing cars have developed. The principle admits of no argument, but the details of its application require much experiment.

Flexibility.

Readers who did not visit the Island may be interested to hear that most of the racers were perfectly docile in heavy traffic. They started easily, and ran in very ladylike fashion at quite low road speeds. I should select the Indian Scouts for special praise in this respect, though I did not notice one sample of the old type, which travels a furlong on each pop, takes one hundred yards to start, and cannot be driven at less than 30 m.p.h.

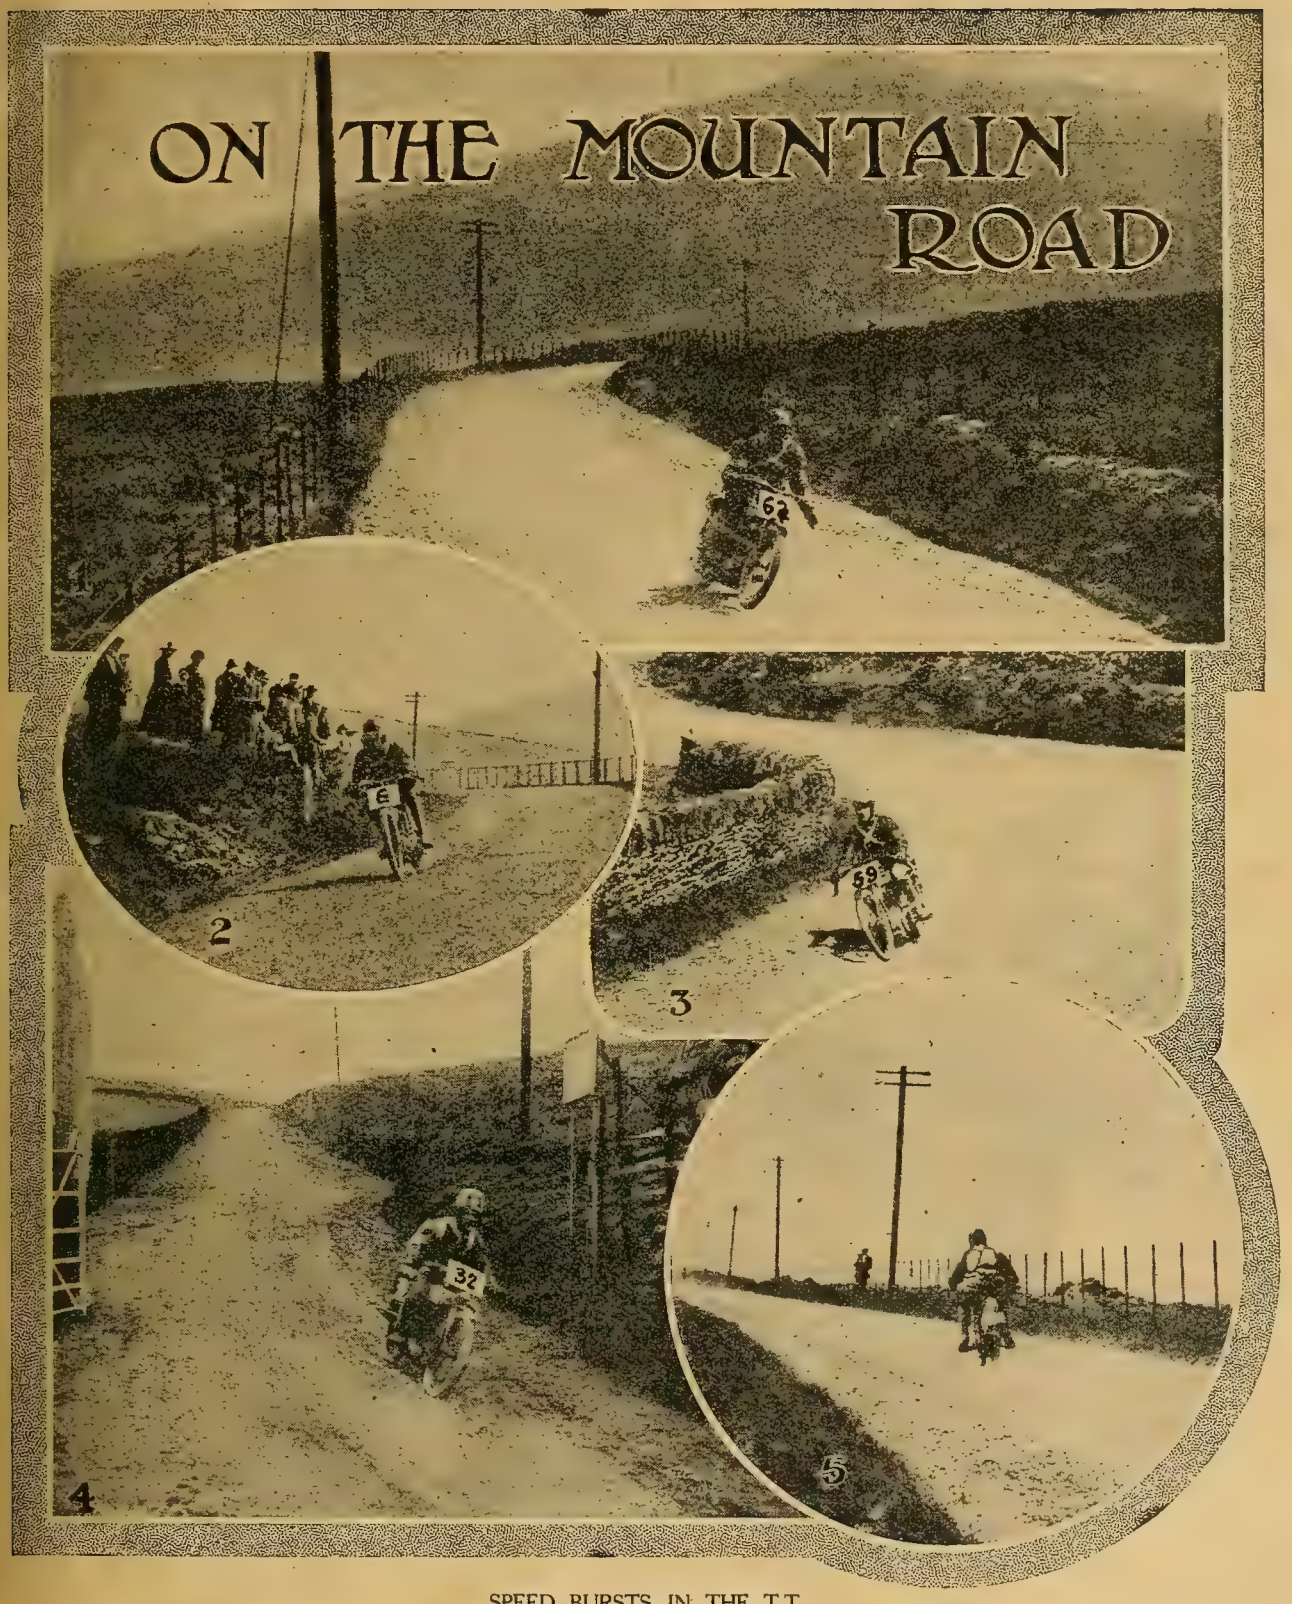
The A.B.C.'s did not last long enough to tell us anything about racing on spring frames. As J. L. Emerson usually binds his up for sprints, I take it that it is very hard to get absolute lateral rigidity, such as the speed cornerist must have.

In conclusion, little notice need be taken of fractured parts. I know such cases were numerous, despite all our talk of metallurgical progress during the war. The A.B.C. advertisements have acquainted motor cyclists with the tests to which steels are subjected in the laboratory of a modern factory. But the steel makers are just as much hampered by unskilled and half-trained labour as anybody else. Steels are difficult to get, and makers have to use what is obtainable. They cannot test every piece over all its length or surface or core. This phase will pass. That a side valve, or an overhead valve, or a gearshaft snapped in the 1920 T.T. means next to nothing. There will not be many such incidents in the 1921 race, for the steel makers will be getting ahead of their work by then. Still, one wee yarn is worth recounting; anti-racing cranks please note. We encountered one designer in the Island who had never heard of the use of stainless steel for valves!

SOME 1921 POSSIBILITIES.

A propos the proposals to limit the 1921 Senior T.T. to 350 c.c. engines, the imaginative motor cyclist has much food for thought. It is now well known that a large Scott entry is expected for this race. A small Scott machine, with cylinders of 175 c.c. each, would strike a new note in lightweights. A 350 c.c. Triumph, B.S.A., or Norton also would be interesting, while the A.J.S. would merely be transferred to the Senior class, as would most of the other competitors in this year's Junior event.

Is it too much to expect little twin two-strokes of 250 c.c. total capacity? Such a machine would go far to meet the demand that exists for a quiet, docile, and smooth running mount. VEDETTE.



SPEED BURSTS IN THE T.T.

Many riders exceed 70 m.p.h. on the descent through Keppel Gate, while the steady climb from the Gooseneck to the Bungalow is always taken "all out." (1) V. Horsman (3½ Norton) approaching the Bungalow. (2) H. R. Davies (2¾ A.J.S.), whose four-speed gear was useful on the mountain. (3) Several slight and therefore dangerous bends occur after the Gooseneck is left behind; the rider is G. W. Walker, on a 3½ h.p. Norton. (4) The treacherous Keppel Gate, where a wobble spells disaster. E. Longden (2¾ Dot-Jap) passing through at speed. (5) F. C. Townshend (3½ Sunbeam) on a fast straight stretch of road 1,300ft. above sea level.

A WEEK IN THE ISLAND.

Attractions for the Motor Cyclist that Abound in the Isle of Man.

The Junior and Senior Races through the Eyes of an Old Hand.

By "ROAD RIDER."

WONDERFUL place, the Island! I can't quite make out why we don't stay there for ever. It offers us every conceivable attraction to suit every imaginable taste. Income tax at 10d. in the £; no duty on imported Indians and Harleys; no speed limit (or if there is one, my 998 c.c. doesn't seem able to exceed it); air like champagne; cheap grub, all of the best and quantity unlimited. Petticoats? Well, if you are a sober Benedict like myself, and take your wife, it's jolly for her to meet all the other fellows' wives, or to indulge in feminine gossip about the other fellows' "Stepneys." If you are young, frisky, and unappropriated, there are flappers galore. The Manx type—grey eyes, with that Connemara smudge beneath them. The Lancashire type, hard hitters in repartee, witty, and shrewd. The yellow-haired sort in pink frocks—I don't quite know where *they* come from. Anyhow, the man who couldn't suit himself along the front at Douglas would be hard to please. Golf — for the scratch man—at Castletown, or for the "rabbits" on the sporting but too crowded links at Fort Anne. Dancing—the giant halls at the Palace and Villa Marina. Motoring—two lurid races in a week, flying kilometres on the sea front, a gymkhana at Belle Vue, and blinding all over the Island, which is really a small chunk chopped off Cornwall, quite as lovely and far more accessible. Picture palaces in every street. Two or three big variety halls with stars like Wilkie Bard and Florrie Forde heading the bill. Fishing. Bathing. Flirting. Pre-war whisky. Pre-war beer. All your best and oldest pals congregated within two square miles or thereabouts. It is a wonderful island, and when you've once been over, you are not likely to miss a single T.T. until you grow old and tiresome.

Nevertheless, I know why we don't all go. The trip includes a sea crossing. My boat was very crowded. After vainly seeking a seat in the saloon, I sacrificed my pride and my ticket, and perched on a bollard in the steerage. An elderly Lancashire dame, travelling alone, instantly capitulated to my personable self.

"Ah've never crossed t' watter afore!" she volunteered. I expressed surprise.

"Ah'm feart ah'll be sick!" she twittered. I expressed scepticism. An hour out from the Mersey she said, "Ah'm feeling summon bad!" I alleged the existence of stewardesses below (are there any stewardesses in the steerage?).

The Gooseneck, where fast cornering may be done. Reg. Brown (3½ Sunbeam) cutting it fine.

A Week in the Island.

"Ah think ah'll take a little walk." I encouraged her mightily. As Kipling puts it, "that fell which fell."

I know also why, having once mustered courage to make the voyage, we do not settle in the Island. Not even a munition profiteer could survive a month there. A hackman, driving a sorry old nag only fit for making straps of, charged me 5s. for a seven-minute drive from the boat. I disgorged money in a continuous stream at this rate during the whole of my stay, and finally came home two days early and paid my hotel bill with a cheque. I have a sneaking fancy that if I once settled in the Island the Manx might cease to batten upon me, and admit me to their fellowship for plundering the Saxon. I have a notion of chancing £100 out of my slender patrimony in making the experiment. Perhaps some day. . . . . ?

Hilberry Corner.

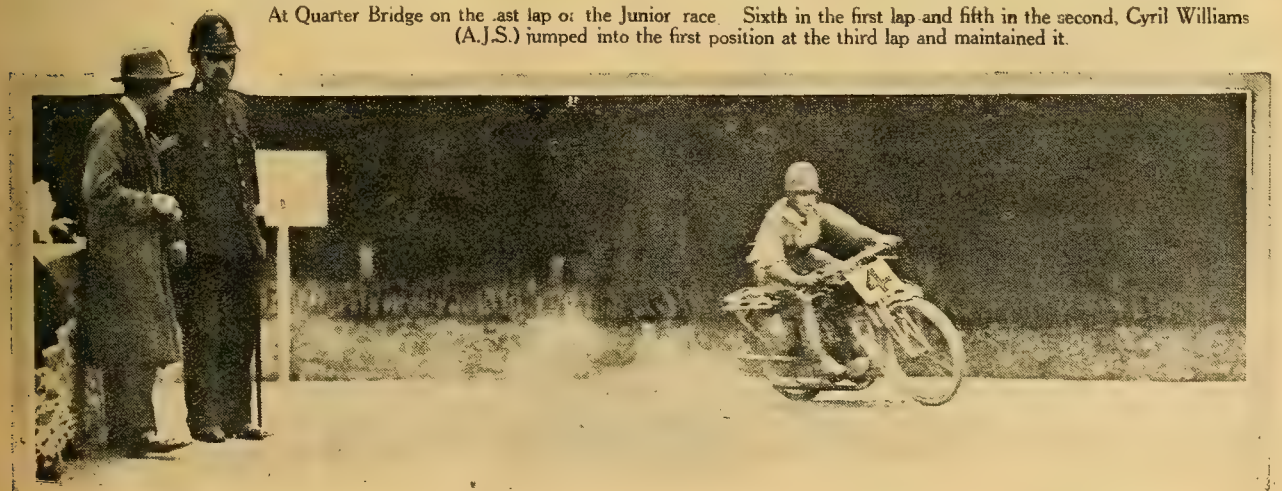
But this is a motoring journal, isn't it? *Revenons à nos moutons*. There are just two places to watch the racing from. One is Hillberry Corner. It is located at one of the thrill spots of the course. Cars *can* take the bend at "70." What with the men who know how to tackle it and the men who don't, you get both the spectacle of sheer speed and that lovely gulp-in-the-throat feeling which the T.T. charm consists of. Moreover, you sit on a comfortable seat on a natural grand stand, and lovely flappers bring you food and drink to suit whatever weather prevails (I should admit that the Manx climate is as capricious as a French *danseuse*). Of course, I went to Hillberry for the Junior. We were wholly fogged by the race, as the A.C.U. carefully withheld all information about the order of starting. So when three riders, say numbers 32, 1, and 17, passed all abreast, we didn't know where we were, but cheered for the best-looking man. There was a rumpus about this on Wednesday, and a starting list was issued for the Senior, which I watched from the official stand. There you have the aid of the huge timeboard and of a gadget like a cricket telegraph or footer league half-time board, which tells you how far the invisible racers have got on the current lap. Also, you see some real speed down Glencutchery Road, and the Castrol depots are right under your nose.

The Junior race was too full of might-have-beens this year. Given a no-trouble run, there was only one team in it, for the A.J.S. was miles faster than anything else. Still, it was exciting enough to watch whether any of them would survive, and if they didn't, would the careful tactics of the Blackburnes pay, or would Clark, who had driven his Levis bluer than any baby was ever rattled along before, stand the awful strain of such audacious cornering for five whole laps? You know the issue—a course strewn with derelicts, a lame winner, two cruisers hunting him home, and a fine sportsman robbed of a sensational victory by hard luck on his last lap. A somewhat disappointing race, crammed with incident.

The Senior Race.

The Senior race was the exact reverse. Everybody knew George Dance could win if he could last the cracking pace which he was sure to set. Alexander on the Douglas, given a non-stop, was almost as formidable. The Sunbeam team manager was afraid that de la Hay might chase Dance off the Island, and kill himself in the effort—it was lucky that the starting ballot put a wide gap between this redoubtable pair. The wizard O'Donovan had been putting the 'fluence over some of the Nortons, and Shaw was reputed a champion road man—more "expected," perhaps, than the old hand "Duggie" Brown. It was undeniable that the Indians were running beautifully, and clocking most regular laps. Everything pointed to a smashing race, and we certainly got it. Dance jazzed off incredibly fast. He lasted one very purple lap: then another still more purple. Finally, it was the engine and not the man that failed to stick as hot a pace as will ever be set. If Alexander's Douglas had been given all-chain drive, he would have taken the lead; but no belt could stand the rip of such a tearaway engine, so he, too, fell out. That left D. M. Brown in the lead, riding the sort of race in which the number of laps doesn't seem to matter; it was clear that Brown and his Norton, like Tennyson's brook, could go on for ever. So, too, could de la Hay's Sunbeam. Whether de la Hay was a bit more of a firework merchant round corners, or whether the Sunbeam engine had one ounce more ginger, deponent knoweth not. But they gave us a top-hole race and a breath-catching finish, and I am still hoarse.

At Quarter Bridge on the last lap of the Junior race. Sixth in the first lap and fifth in the second, Cyril Williams (A.J.S.) jumped into the first position at the third lap and maintained it.



A Week in the Island.—

Then the tension relaxed, and we devoted the rest of the week to more frivolous amusements. I did not go to the horse races. Experts told me that it is unprofitable—that if you put £5 on a horse, it never wins. We all went to the Palace—3,000 couples jazzing on a perfect floor in a crush like a Bakerloo Tube about 7 p.m. is some sight. Kilometre trials on the sea front: George Dance doing 75 m.p.h. down a narrow bottleneck of human beings, with loose dogs about and the certainty of a frightful holocaust if he came over!

Then there was the excitement of trying to keep half-a-dozen appointments at once—a difficult problem when one's friends are in different camps and every man is bound to be at some one else's hotel. Did you promise to take a certain fair lady to the palace? (Or was it a golf match with her husband?) then it was a sure sign that the Editor would send a message from the Sefton that you were required to attend some function to celebrate the victory of somebody's tyres, or belts, or carburetters. Two such celebrations in one evening help the confusion.

"What would my wife think of me?" is a question one only asks when the confetti gets mixed up in the early morning cup of tea while feeling across the counterpane for one's case of cigarettes.

And by the time evening comes round again one is fit to enter into impromptu contortionist competitions against double-jointed experts for the I.O.M. hospital.

Finally, a sea as calm as a pond, and a farewell of fireworks for the midnight boat.

Next Year's T.T.

Well, here's to the 1921 T.T. *What* a race we shall have, gentlemen! The Scott people talk of entering twenty-four machines. Triumphs will have to be there, or the Sunbeam will be challenging their long-established claim to be our premier single. Harley-Davidsons will be a new ally for the Indians. Granville Bradshaw will doubtless put in a team of A.B.C. engines, capable of 8,000 r.p.m. The Rudges will defend their 1914 title — and they have a *flair* for unearthing three new first-class jocks every year. Douglases now make a 3½ h.p. The Collier brothers will hardly be content to look on. The Duzmo, as a hot-stuff sports solo, must enter in force. Is the Island big enough to hold 100 machines of the probable calibre? Anyhow, it should be *some* race.

SENIOR PACEMAKERS AT VARIOUS POINTS OF THE COURSE.

(Top) D. M. Brown (Norton), who finished second in the Senior race, at the Gooseneck, Ramsey. (Left) Noel Brown settling down after "jumping" Ballig Bridge. (Right) G. Dance (Sunbeam) at Ballacraine

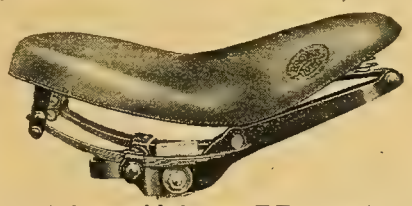
THE TECHNICAL ASPECTS OF THE T.T.

A Review of the More Salient Features of the Isle of Man Races from a Technical Standpoint.

FINISHING TOUCHES.
De la Hay, the Senior T.T. winner, finally looking over his machine.

FIRST impressions are apt to be deceptive, and this remark is especially true of the results of the 1920 Tourist Trophy races.

A glance at the finishers shows apparently that machines designed on standardised lines absolutely swept the board, whereas specialised high efficiency engines in the majority of cases failed to finish. This conclusion, though true, is misleading, for on closer inspection we find that the causes of failure were mainly due to the fact that the violent acceleration produced by the high efficiency cylinders caused fractures in the transmission or other engine parts.



It is essential that the T.T. competitor rides as comfortably as possible. The Brooks New B225 saddle has been designed for the speed man, and formed part of the equipment of the winning Sunbeam

This points to a common failing in all early developments: that one feature has been developed without corresponding attention being paid to the results. It is obvious, for instance, that a crankshaft and transmission which have proved to be sufficiently strong for the needs of a cylinder developing, say, 6 h.p. will not necessarily stand up if an extra 2 or 3 h.p. are coaxed out of a cylinder of the same capacity.

Oddly enough, a certain amount of valve trouble was experienced by engines of all types. This is curious, since, although the fearful gruelling imposed by about two hundred miles of road racing is extremely hard on valves, there should have been no failures in this respect if suitable steel had been used.

Possibly the unreliability of some present-day steels is responsible for some of the troubles, though, from certain remarks overheard in the Island, it would seem as if one or two manufacturers have not taken advantage of recent improvements which were brought to light during the war.

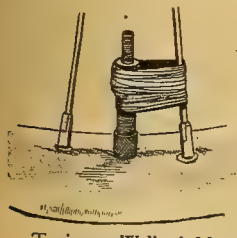
The 250 c.c. class proved something of a walk-over for the small two-stroke, and the performance of the Baby Levises was an eye-opener for those who consider that two-stroke engines are bound to overheat if driven hard.

In the Junior race we were able to see the little two-strokes at their best, and, not only that, but maintaining their best for 190 miles of all-out driving. Over 38 m.p.h. is no mean speed for a 250 c.c. engine, but to average such a rate over a tortuous and hilly course for hour after hour is indeed a startling performance.

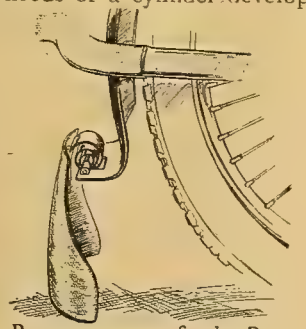
How was it that the little engines held their tune, and, when stripped by the examiners, showed free piston rings and a wonderful absence of carbon? Undoubtedly the answer lies in the aluminium cylinder construction, the first to appear in the Manx races.

Long experience of two-strokes and sound design are, of course, essentials, but I am sure that Messrs. Butterfield will agree that without the aluminium cylinders the performance would have been improbable, if not impossible. Whether the particular cylinder construction used in the race will prove to be the final form remains to be seen. It undoubtedly has its advantages, but the "poultice" head type is apt to require frequent refitting if the best results are to be maintained.

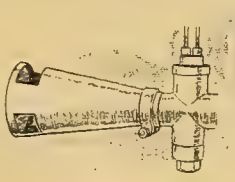
The consistent running of the Blackburnes was most meritorious, and the firm is to be congratulated on obtaining second and third places with practically standard machines. Watson Bourne is a heavy rider for the



Taping on Walker's Norton, which prevented the valve nuts working loose

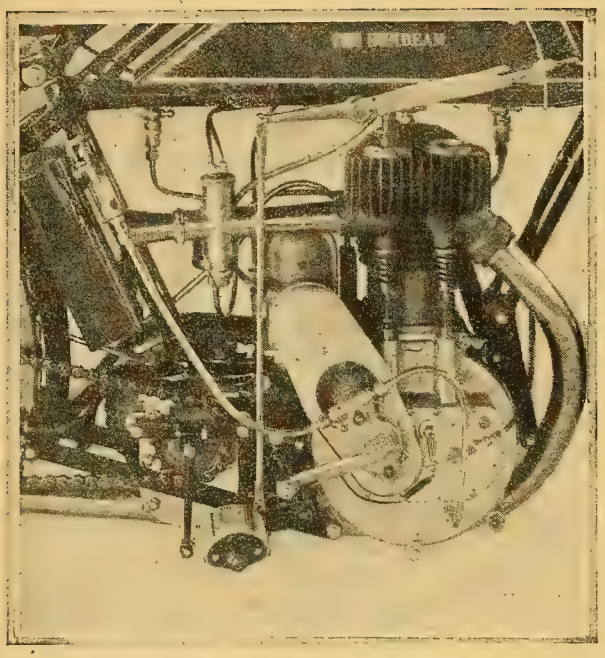


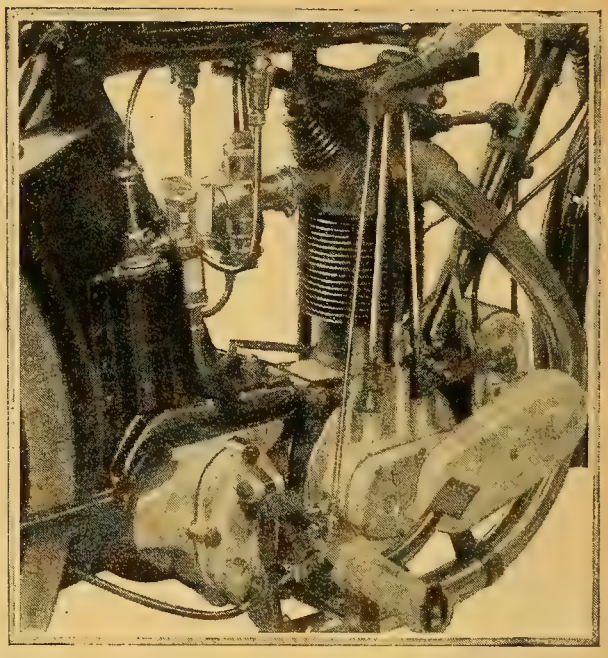
Puncture-preventer fitted to Petty's Norton in front of the rear wheel



Air extension to the carburetter of North's Norton.

The drilled piston used in the A.J.S. T.T. machines.





THE WINNING ENGINES OF THE SENIOR AND JUNIOR T.T. RACES.

A separate head with side-by-side valve gear distinguished the successful 3½ h.p. Sunbeams. Mechanical lubrication also contributed to their fine performance.

Overhead valves operated by long push rods were an outstanding feature of the 2¾ h.p. A.J.S. The separate head was held down by a steel strap tightened by turn buckles.

Junior class, and J. S. Holroyd was inclined to be cautious on corners, or their average speeds might have been slightly higher. After all, it is probable that the firm was out to demonstrate the reliability of its products rather than to win.

While on the subject of the T.T. Blackburnes, which are the prototypes of a new model, I am inclined to hope that the outside drive will be retained in future engines, as the short crankshaft should help to obviate torsional oscillations, especially if the crankshaft is hollow.

The exhaust heated induction pipe on A. H. Alexander's 3½ h.p. Douglas. The arrows indicate the path of exhaust gas through the heater.

Eric Longden's Dot-Jap showed a remarkable turn of speed, but the Diamond team were handicapped by too short an experience with the three-valve J.A.P. engine. This little single-cylinder engine, with its two inlets and one exhaust, quite obviously was intended for a different future when it started life in the drawing-office, but I am inclined to agree that, if more than two valves are necessary for a 250 c.c. cylinder (a very questionable point), two inlet valves and one exhaust are preferable to the opposite arrangement.

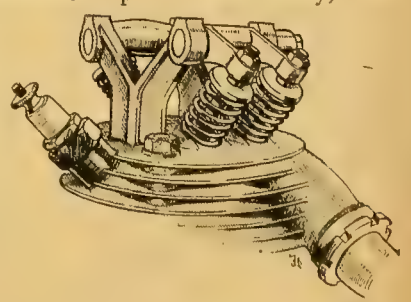
The Ivy two-stroke was fast and well ridden, but suffered hard luck in the breakage of an oil pipe, which naturally caused considerable delay.

As usual, the 2¾ h.p. Douglases performed steadily, and, if Alexander had not dropped out, there is no knowing what would have happened, since his old 1914 mount was going particularly well.

The A.J.S.'s were the fastest machines on the course by several miles per hour, and everyone who is looking forward to increased efficiency and advance in design will share with the makers their disappointment in the fact that, with one exception, the new machines failed to finish. The reasons are sufficiently explained at the beginning of these notes, and the one exception produced perhaps the most sensational win in the annals of the T.T.

The Senior Race.

Sunbeams, Nortons, and Indians provided the only finishers, but of the "also rans" there were one or two interesting performances. Of these the most notable was A. H. Alexander's overhead valve Douglas. The speed of this machine was wonderful, and it provided the fastest lap of the day, with the exception of Dance's second lap. Unfortunately, once again the transmission was not equal to the power of the engine, and constant belt trouble eliminated this very promising performer. Le Vack's overhead valve Duzmo had an extraordinarily healthy crackle, and ran well up for the first few laps. This is an interesting engine of which more will be heard later. The A.B.C.'s were not entered by the makers, and both failed to make any serious showing. Davies's little A.J.S. made a very fine lap, and his acceleration was terrific—in fact, it was superior to that of the majority of the Senior machines.

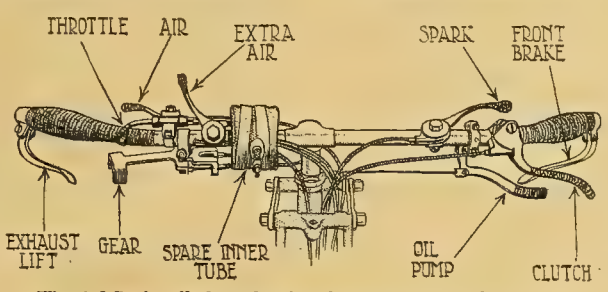


Cylinder head of J.A.P. engine used on the Diamond machine. Two inlet valves and one exhaust were employed.

AN ANALYSIS OF TYPES IN THE TOURIST TROPHY RACES.

	Started.			Finished.			Positions.
	Junior.	Senior.	Total.	Junior.	Senior.	Total.	
Single-cylinder two-strokes	6	—	6	5	—	5	Junior: 4th, 7th, 9th, 10th, 11th
Single-cylinder four-strokes	13	20	33	4	11	15	Junior: 1st, 2nd, 3rd, 8th. Senior: 1st, 2nd, 3rd, 4th, 7th, 8th, 9th, 11th, 12th.
Flat twins	4	3	7	1	—	1	Junior. 6th.
V-twins	1	3	4	1	3	4	Junior: 5th. Senior: 5th, 6th, 12th.
Overhead valves	10	5	15	2	—	2	Junior: 1st, 5th.
Overhead inlet only	1	—	1	—	—	—	
Side-by-side valves	7	21	28	4	14	18	Junior: 2nd, 3rd, 6th, 8th. Senior: 1st, 2nd, 3rd, 4th, 5th, 6th, 7th, 8th, 9th, 10th, 11th, 12th, 13th, and 14th

All eyes were on the Indians until it became apparent that they would not win unless half a dozen leaders cracked up. Weight was against the Scouts, and they were also handicapped by the absence of front wheel brakes. In spite of this, they performed consistently, and both D. Alexander and Harveyson were always well up. As sole representatives of the V twin in the Senior race, especial interest attached to the Indian entry, but the single cylinder again proved invincible. Norton machines were so nearly standard that there is little of fresh technical interest to be said on the subject. The very fact that a practically standard machine proved capable of giving the winner a close run for his money, and of obtaining seven more places, including the fourth position, is sufficient evidence of the designer's ability and the high efficiency of the firm's standard productions. Without a doubt the Sunbeams were ideally suited to the course. They had been designed and built specially for the work with that thoroughness which is characteristic of the Wolverhampton firm, and they were superbly ridden. A separate head is a new feature for the Sunbeam 3½ h.p., but from the method of attachment I gather that it was a separate head, from a constructional point of view, rather than a detachable head from the rider's standpoint. Not only was the engine a fine job, but the gear box also had been carefully suited to the race, all unnecessary friction had been carefully eliminated, and the change was noticeably sweet.



The A.J.S. handle-bar, showing the arrangement of the nine separate control levers.

There are one or two hardy annuals which crop up regularly at Tourist Trophy time, but which should be mentioned once again in hopes of future improvement. As usual, almost every rider considered it necessary to tape all the "twiddly bits" to prevent loss, and the fact that the winner of the Junior race was delayed through lack of this precaution is surely a reflection on the present state of mechanical perfection.

Every time that the Manx races take place, special provision is made to render lubrication an easy operation, and, though it may be admitted that the average rider has more leisure for actuating a pump, he should surely be allowed the luxury of a handle-bar or foot control for the pump.

In conclusion, the absence of more trade entries was most regrettable, though it is not likely to occur again. There are many lessons which can only be learned by a close observance, or, better still, actual participation in the great event, and a well-known manufacturer volunteered the information that he had gained at least £10,000 worth of information from the 1920 races.

UBIQUE.

The Scottish Six Days Trial.

THE sporting, but strenuous, Six Days Trial organised by the Edinburgh M.C., starts next Monday. Over a hundred competitors are supporting the event, which this year embodies many new features. The Trial will start from Perth instead of from Edinburgh as in previous years. The second day includes a run to John-o'-Groat's, while the last day's route starts and ends at Edinburgh. As in previous Scottish Six Days, members of *The Motor Cycle* staff, with photographers, will accompany the competitors, and a full description of the trial will appear in subsequent issues. The six routes finally chosen by the organisers are as follow:

FIRST DAY: PERTH—INVERNESS.

Perth, Kenmore, Pitlochry, Kirkmichael, Braemar (lunch), Crathie, Tomintoul, Grantown, Inverness. TEST HILLS.—Amulree, Cockbridge, Bridge of Brown.

SECOND DAY: INVERNESS—THURSO.

Inverness, Abriachan, Beauly, Dingwall, Lairg (lunch), Tongue, Melvich, Thurso, John-o'-Groat's, Thurso. TEST HILL.—Abriachan.

THIRD DAY: THURSO—INVERNESS.

Thurso, Latheron, Dunbeath, Brora, Lairg (lunch), Evanton, and Inverness.

FOURTH DAY: INVERNESS—INVERNESS.

Inverness, Drumnadrochit, Invermoriston, Cluanie, Glenelg (lunch), Tomdoun, Invergarray, Glendoe, Inverness. TEST HILLS.—Glendoe and Man Rattachan.

FIFTH DAY: INVERNESS—EDINBURGH.

Inverness, Kingussie, Pitlochry (lunch), Ballinluig, Grantully, Weem, Kenmore, Edinburgh. TEST HILL.—Kenmore.

SIXTH DAY: EDINBURGH—EDINBURGH.

Edinburgh, Broughton, Tweedsmuir, St. Mary's Loch, Innerleithen (lunch), Gifford, Garvald, Spott, Elmscleugh, St. Agnes, Haddington. TEST HILLS.—Talla Linns, Redstone Rig, and Elmscleugh.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

ANGLO-DUTCH TRIAL.

Sir,—Your correspondent, F. A. Hardy, expresses my thoughts on the above trial, and as captain of the trade team for two years, I am naturally anxious to ride again for this country.

I hope the A.C.U. will give those riders who represented England before a chance of offering their services again.

W. PRATT.

A PINCH OF SALT.

Sir,—I read some time ago a letter from a correspondent asking if anyone had tried the *Scientific American's* tip for decarbonising, *i.e.*, with a teaspoonful of salt put in the cylinder. As I intended cleaning out my engine the other day, and thinking the Yankees may have made a discovery—apart from the fact that England was also in the late war—I tried it: result, *nil*! A. G. GILL.

HAND CLEANSER.

Sir,—Letters have recently appeared in your columns advocating various cleansing preparations. After repairing or otherwise handling greasy chains, etc., the hands should be well rubbed with a small quantity of engine oil drawn from the tank by the oil-gun or lubricating oil from the oil-can. If the oil has been well rubbed in, ordinary soap and water will do the rest. PALE HANDS.

Harrogate.

REUNION OF EX-D.R.'S

Sir,—Your correspondent, ex-Sergeant Schofield, writes to say he is trying to arrange a D.R.'s reunion. If this can be fixed up it will be excellent, but may I respectfully ask our ex-Sergeant why he restricts it all to "1914 D.R.'s"? Surely there were some good fellows who enlisted afterwards, and I can't think Mr. Schofield considers the old remark, "Before you come up, chum!" is fair to all late arrivals.

Derby. UNDER AGE AT FIRST.

BEHAVIOUR.

Sir,—Can you, or any medical expert, solve the following problem?

Eastbourne, I believe, is one of the healthiest spots on the south coast, and its air particularly bracing for invalids and those generally "out of sorts."

Yet this same air seems to have a very adverse effect on certain youthful motor cyclists of a class unfortunately becoming only too common nowadays.

They spend most of the day riding up and down the front with open exhausts and the lowest of Brooklands bars: the machines, needless to say, are standard in every other respect. When they do stop, at a point invariably opposite the bandstand, where there is always a crowd, they loudly proclaim their ability to exceed 60 m.p.h. And, recently, I witnessed the extraordinary phenomenon of four up on a lightweight two-stroke.

I am wondering if there is any cure for this form of mental derangement, or whether all these unfortunate sufferers will eventually be certified and vanish from a sorrowing world into an asylum for such cases. The world will sorrow, not for their loss, but for the very justifiable police activity which may be expected as a result of this alarming mania.

Eastbourne. NOT YET DIAGNOSED.

LEFT SIDE DRIVE.

Sir,—I hold no brief for foreign vehicles with left-hand drive, but it seems to me that, instead of making a lot of undignified fuss, as we now appear to be doing over these dangerous customers, a better plan would be to look out for some effective means of eliminating the danger in those among us. Would it not be simple to make it illegal for them to be on the road without means of signalling to the right, by means of a disc or flag on a stick or some other form of semaphore, to be actuated by the driver in substitution for the usual hand signal. J. HARRISON.

SANS MAGNETO.

Sir,—Have any of your readers had the following curious experience? Whilst riding a 2½ h.p. Levis without the usual magneto chain cover, I was obliged to stop at the corner of some cross roads when I noticed that the magneto chain was no longer in position. I naturally concluded that it had come off at the moment of stopping and proceeded to look about for it, but the most persistent search failed to locate its whereabouts. A cyclist coming along the road I had just passed over produced the chain, informing me that he saw it come off about half a mile prior to the place at which I stopped. *I had ridden half a mile without a magneto chain.* The engine was very hot at the time, and the only reason I can give is that a piece of hot carbon on the cylinder head was sufficient to fire the charge on compression, but not sufficiently hot to cause pre-ignition. A. R. JONES.

On his fastest lap. An impression of G. Dance taking a winding section on the mountain road.

POLICE PERSECUTION.

Sir,—The time has arrived when all motorists and their associations should use every endeavour to stop this waste of time in seeking technical offenders, whilst real criminals remain at large. The disappearance of "drunks" has caused the policeman to look for motorists as a sort of stock case to help justify his existence.

How can the burgled householder grumble over his loss, when he contemplates the splended organisation of a "police trap"—concealed, except for its feet, with ingenuity worthy of the legitimate stage.

Never have we had such an epidemic of robbery, and never such vigilance from the police for technical offenders, who often prefer a case to go in default, the cost in actual cash being the same, win or lose.

It is full time that motorists urged their various representatives to do something towards abating this waste of time—for which they have to pay. CRICKET.

S.W.17.

Sir,—May I reply to Mr. Pennington. My letter was quite plain enough for even the simple brain to take in, if it was properly read before replies of this kind were written to it. Mr. Pennington says, "I fail entirely to see where his grievance is." Does he? Well, I pity his understanding. Let him read my letter again, and he will see that I complain of being stopped *several times* in one day and delayed on my journeys whilst policemen measure up, and examine licences, etc. If Mr. Pennington was a long-distance rider he would perhaps get to understand how annoying it gets to be frequently held up. I take a delight in keeping my machine nice. I never yet had number plates, silencer, or licence out of order. I have never been a road hog, and hope I never shall be. I observe ten-mile limits as closely as I can, and I always take the line that one gets trouble without being foolish enough to go out and look for it.

It is all very well where machines are used for merely pottering about on and riders have time to be wasting, but when one uses a machine for business, as I do, and has to ride long journeys, then stopping and undoing coats to get out licences, getting off and putting the machine on the stand, and being held up whilst policemen play about with foot rules and poke pencils in silencers all cause delay, and it is this I object to. If Mr. Pennington had been held up for half an hour or more whilst a long line of cars and motor cycles were examined on the roadside, then he would take a different line I fancy. I have had some, and if it has become so necessary to have these roadside hold-up schemes, then let us all have to take our machines to our local police station, have them examined there, and a card or disc handed out to us to say that the machines comply with the regulations. It would then be merely a question of stopping, producing licence and card, and going on quickly.

Will he tell me why, as a motorist, I should be subjected to interrogation of this kind: "Where have you come from? Where are you going? When and where was your machine registered? Have you baffle plates in your silencer? Are your numbers the correct size? (Then wait whilst the rule is run over them.) Have you any endorsements on your licence?" All of which questions the Motor Car Act does not give any power to the police to ask.

No. The system is wrong, and it is the meek and mild lambs who tamely submit who are helping us to be subjected to this petty annoyance. Perhaps Mr. Pennington will now see where my grievance is, and having re-read my letter of June 3rd will see that he replied without thought or realisation of how some of us are really badgered for no useful purpose at all. R. C. MEASURES.

Sir,—I read with much interest the letter in your issue of June 17th, signed "The Victim." I spent all last summer in the Furness district, and covered several thousand miles on my motor cycle, and never met with anything but courtesy and assistance from the police. Perhaps this was because I am middle-aged and cautious, and did not blind through the narrow and winding streets of towns like Ulverston at even twenty miles an hour. The truth is that motor cyclists have not too good a name, either in the Lake District or anywhere else, owing to the selfish propensity of many of the younger members of the fraternity to "barge" along at speed, no matter who else is on the road or in the street. I saw a lot of it in the North, and only escaped several bad spills by pure luck, owing to solo riders blinding round corners at speed, and not always on their own side of the road. Now I am in the South, where the roads are better and it is easier for the quieter type of motorist to get along, though one sees plenty of bad driving here.

I was talking to a car owner at Keswick last autumn, and he said he considered there were three curses on the road at present, viz., chars-à-bancs, hired Ford cars, and motor cyclists.

Though a very ardent motor cyclist myself, I must endorse his opinion. I should say that "Victim" just about got what he deserved. E.Q.

Portsmouth.

Sir,—I have read the letter from the Rev. R. C. Measures calling for help from the A.A. and A.C.U. to fight the petty tyranny of the police. I hope very much that his call will be heard and answered by the associations.

The behaviour of the police is at times quite intolerable, and we find the men who are supposed to keep peace and order doing all they can to badger, bully, and create discord amongst the community.

Policemen in these days are given very wide powers, where discretion, judgment, and commonsense are needed. These qualities are possessed only by a few. Reform is needed badly, and I only hope the A.A. and A.C.U. will act immediately. C.L.W.

Malvern.

[Many similar letters on police persecution have been received which are unavoidably held over.—ED.]

THE 1920 T.T. The assembled competitors at the starting point of the Senior race.

SHOULD BELTS BE RUN IN ONE DIRECTION?

Sir,—About the question which you ask concerning belts. I may say that I have ridden several belt-driven machines, and at present possess a 3½ Rudge-Multi. I have "pulled out" many belt-fasteners in my time, and have never bothered which way I replaced the belt. If there is a difference caused thus, surely a variable belt device like the Multi gear should show it? RUDGE RIDER.

Uppingham.

SPEEDS.

Sir,—May I add a few words *re* the very interesting correspondence on "Speeds." I cannot help thinking that the Brooklands speed wizards must begin to feel mighty jealous. "C.B.W.'s" letter, in which he says he obtained a speed of 70 m.p.h. on an Indian, with a passenger on the back, is, I think, really marvellous. Personally, I have experimented with different sized sprockets and belts on my Triumph, but I should not care to boast more than 55 to 60 m.p.h., over a timed mile and *not* by speedometers.

Shoreham. TRANCHE DE VENT.

A USEFUL FITTING.

Sir,—I should like to bring to the notice of motor cyclists—two-strokists especially—the remarkable discovery that I have made in the small accessory market. The article is a small cast aluminium plug cap, known as "the O. and J. patent plug protector and radiator." While in London a short time ago I called at a suburban garage for a new plug, and was asked to purchase one of these little articles, which I did. The cost was quite cheap, I thought, at 1s. 4d. each.

I did not put the protector on my plug for the run back home of about eighteen miles.

The next time I decided to go for a run (my machine is a Levis) I placed the radiating cap upon my Apollo No. 1 plug. I was amazed with the results!

On the level I noticed very little difference, only that the engine seemed to keep up prolonged bursts of speed for a greater distance without making the usual two-stroke rattle perceptible; but on hills it was a boon. I can really recommend the little fitting, and it quite enhances the appearance of the plug.

I have since given mine to a friend, who is delighted with the results. His machine is a 4¼ h.p. Triumph.

PERCY M. JAMES.

TOLLS.

Sir,—As the increased taxation seems inevitable, could not some effort be made in your editorial columns and by the powerful motoring organisations to put a stop to the system of toll gates that still exist on many bridges on our main roads and in many places where there are no bridges at all?

Recently while touring in North Wales with a sidecar outfit I had to pay the sum of ninepence twice within a distance of two miles. At Sandwich, Kent, on the main Margate and Ramsgate-Dover road, a similar sum has to be paid by all who go over the bridge at the Barbican, except pedestrians and pedal cyclists.

My business necessitates me going to Sandwich a good many times during the year, and these sums mount up very considerably. There are only two roads out to the Isle of Thanet, which, in a way, is as much an island as the name indicates, and is a corner of the world, and one way is through Sandwich. The other road is so bad that on a "joy ride" all the pleasure is taken away and damage caused to the machine. *Pullen's Kent Argus*, one of the local papers, has already advocated the abolishing of paying tolls here, but up to the present no notice has been taken by the authorities. The money collected is supposed to go towards the upkeep of the bridge, but the balance-sheet at the end of the year must show a very substantial credit, even after the toll-keeper's wages and all repairs have been paid for. If you could manage to have this pernicious system abolished I am sure you would secure the gratitude of all motorists.

Ramsgate. A BUSINESS DRIVER.

WHERE ARE THE SCOOTERS?

Sir,—"Where are the scooters?" Yes, sir, and where is this wonderful country we were all going to live in happy ever after this terrible war, and the house problem, the mass production cars and motor cycles to be almost given away. This certainly doesn't answer your query, but how is any one on these shores to turn out a decent scooter at £25 at the present day value of money? Certainly I agree the principal makes of scooters are in the neighbourhood of £50, or over, which naturally is beyond a lot of people, besides being too much money for such an article; but one must take into consideration that a well-known make of "push bicycle" costs anything around £20 and over, and that without lamps and bell, etc. I understand the best known make of scooter cannot be turned out in sufficient quantities to cover demands, but like a lot of things in the "home country," very little encouragement is given to anything new, it is the foreigner who makes us see things. (The aeroplane industry in this country before the war is a typical example—the Germans held almost all "aero" records.) It must be borne in mind that those using these little mounts are usually ladies or gentlemen who know nothing about the motor mechanism, and therefore at the slightest sign of trouble they are unable to effect a remedy, and the agent or repairer has to be sought; and there are those who buy these machines who possess cars, and after a few spins naturally think the little scooter is not so comfortable as their Rolls-Royce car, forgetting altogether what the scooter was designed for. These little mounts have still some way to go before being up to the modern motor cycle reliability, but let us just think of the mounts we had fifteen years ago and the "fun" to keep 'em going! It is essential to help a young industry with good criticism lest someone takes it from us and shows us "what and how to do it." We must not forget the magneto problem at the commencement of the war: as usual, our only source was from abroad, which caused things to be very unpleasant for quite a time. HAROLD SOLOMON.

PLUG EFFICIENCY.

Sir,—I have had a great deal of trouble with plugs on my 1915 Levis popular model. I have tried nearly all makes of plugs, but they have all "konked out" after very little use. I was recently going through the local repairer's scrap when I came across an old rusty plug. Having cleaned it and fitted it to my machine, I have not had the slightest trouble since. It has most unusual sized points and the body is of porcelain. W. D. THOM.

A WARNING.

Sir,—Perhaps a little experience which befell me recently might be of interest to your readers. I was about to vault into the saddle of my countershaft machine, when my trench coat caught in the belt pulley and was dragged right round the clutch sprocket. I was pulled right down on to the tank, the engine pulling up dead, leaving me absolutely powerless to do anything. I tried to get out of the coat, but was too close to the tank to get my arms out of the sleeves. Then I tried tearing it out of the pulley, but with no effect, and I could not even move the bicycle backwards or forwards. I simply had to hang on until two passers-by came along and released me by removing the chain case and turning the engine backwards. TRANCHE DE VENT.

Shoreham.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

Issued in conjunction with *The Motor Cycle.*

	Price net.	By post
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook of the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

Loughborough and District M.C.C.

A reliability trial has been arranged by the above club to take place on the 4th inst. The course is a sporting one confined to a thirty-five miles radius of Loughborough.

Bridgwater and District M.C. and L.C.C.

The Carver cup reliability trial to Land's End will be held on the 17th inst. Full particulars and entry forms can be obtained from the hon. sec., Mr. J. W. Hooper, The Oaks, Wembden, Bridgwater.

Dewsbury and District M.C.C.

Entries for the 100-mile Fitton trophy reliability trial, fixed for the 10th inst., should reach the sports secretary not later than the 3rd. The starting point will be at the Town Hall, first competitor leaving at 2 p.m. The sports secretary is Mr. W. Robb, 31, Wheatreyd Terrace, Healey Road, Ossett.

Bargoed and District M.C.C.

Two classes, solo and sidecar, were run in the hill-climb held recently at Top Hill, near Bargoed, the results being as follow: Solo—1, R. Saunders (4 Douglas), gold medal; 2, W. Merchant (King Dick), silver medal. Sidecar.—1, A. Prichard (4¼ B.S.A. sc.), gold medal; 2, G. Gregory (7-9 Harley-Davidson sc.), silver medal.

Stevenage, Hitchin and District M.C.C.

It is proposed to form a club for Stevenage, Hitchin, and the surrounding district, which will hold the above title. Any motor cyclists who are interested are asked to communicate with the secretary *(pro tem.)* at the Sun Hotel, Stevenage, Herts. A meeting is to be called at a later date. The club is to be affiliated to the A.C.U., the A.A. and M.U.

Cardiff M.C.C.

Arrangements have been made to hold a hill-climb on Rhubina Hill, five miles from Cardiff, on Saturday, starting at 2.30 p.m. There will be six classes for solo machines and sidecars, and the event is open to members of any club in the Welsh Division of the A.C.U. The course is 940 yards long with an average gradient of 1 in 7-8. Entry forms and full particulars can be obtained from Mr. J. J. Boyd-Harvey, 37, Salisbury Road, Maesteg, Glamorganshire.

Derby and District M.C.

The results of the hill-climb held recently by this club at Hazelwood Hill were as follow: Class 1 (handicap), H. Dawson (4 Triumph sc.). Class 2 (formula), T. Hill (2¾ Douglas). Class 3 (formula), H. Palin (3½ Norton). Class 4 (formula), G. W. T. Hartwell (3½ Norton sc.). Classes 5 and 6 (formula), G. W. T. Hartwell (3½ Norton sc.). Fastest time up to 350 c.c., T. Hill (2¾ Douglas); over 350 c.c., H. W. Merrill, jun. (3 A.B.C.).

Week-end Club Events.

July 1.—Doncaster and District M.C.C. Gymkhana.
July 1.—Carmarthen M.C. and C.C.C. Speed Trials.
JULY 3.—EAST LANCASHIRE M.C.C. OPEN HILL-CLIMB AT WADDINGTON FELLS.
July 3.—N.M.C.F.U. (Coventry). Hill-climb.
July 3.—Dewsbury and District M.C.C. Run to Boston Spa.
July 3.—Bath and West of England M.C. Paperchase.
July 3.—North Lindsey A.C. Run to Baslow.
July 3.—Surbiton and District M.C.C. Hill-climb.
July 3.—Eastern Valley M.C.C. Surprise Run.
July 3.—Woolwich, Plumstead and District M.C. Picnic.
July 3.—Ilkley M.C. and L.C.C. Reliability Trial.
July 3.—Birmingham M.C.C. Lightweight Trial.
July 3.—Wolverhampton M.C.C. Stevens Cup Trial.
July 3.—Lancaster, Morecambe, and District M.C.C. Captain's Run.
July 3-4.—Public Schools M.C.C. Week-end Run.
July 4.—Lancaster, Morecambe, and District M.C.C. Run to Whitewell.
July 4.—Loughborough and District M.C.C. Reliability Trial.
July 4.—Dewsbury and District M.C.C. Run to Ashopton.
July 4.—Canterbury and District M.C.C. Speed-judging Competition.
July 4.—North London M.C.C. Paperchase.
July 4.—North Lindsey A.C. Monsal Dale.
July 4.—Newcastle and District M.C. Team Trial.
July 4.—Essex M.C. Standard Ride (qualifying).
July 4.—Manchester M.C. Speed Trials.
July 4.—Stalybridge and District M.C. Reliability Trial.
July 4.—Harrogate and District M.C.C. Reliability Trial.
July 4.—Bedford and District M.C. and L.C.C. Club Run.
July 4.—N.M.C.F.U. (Leeds). Run to Hambleton Hill.
July 4.—N.M.C.F.U. (Wolverhampton). Run to Leamington Spa.
July 4.—Reading and District M.C. and L.C.C. Run to Wisley Hut.
July 4.—Exeter M.C. and J.C.C. Run to Luppit Common.
July 4.—N.M.C.F.U. (Portsmouth). Run to Waggoner's Wells.
JULY 5-10.—SCOTTISH SIX DAYS TRIALS.
July 4.—N. Wilts M.C. and L.C.C. Cheltenham.
July 4.—Sheffield and Hallamshire M.C.C. Paperchase.
July 6.—Lancaster, Morecambe, and District M.C.C. Competition.
JULY 7.—GRAND PRIX RACE.
July 7.—Loughborough and District M.C.C. Run to Coleorton.
July 7.—N. Wilts. M.C. and L.C.C. Surprise Run.
July 7.—York and District M.C. Picnic.
July 7.—Scarborough M. and M.C.C. Reliability Trial.
JULY 7-8.—ARBUTHNOT TROPHY TRIAL.
July 8.—Canterbury and District M.C.C. Hill-climb.
July 8.—Cumberland County M.C.C. Hill-climb.
July 8.—Oxford M.C. Picnic White Horse Hill.
JULY 8.—EASTERN VALLEY M.C.C. OPEN TRIAL.
July 10.—Northern M.C. Reliability Run.
July 10.—M.C.C. Brooklands Meeting.

The Wasps M.C.C.

A new club with the above title has recently been formed in Cambridge, and any local motor cyclist interested should communicate with the hon. sec., Mr. W. N. G. Phillips, Winslade, Hill's Road, Cambridge.

Grimsby M.C.C.

Several social runs and sporting events have already been held by this recently formed club, and a good programme has been drawn up. It is desired to form a catalogue library, and any manufacturers' or accessory dealers' booklets will be welcomed by the secretary, Mr. H. W. Crampin, 169, Welholme Road, Grimsby.

Grantham and District M.C.C.

A motor cycle club has just been formed under the title of the Grantham and District M.C.C. Secretary, L. W. R. Morley, Motor Works and Garage, Great Ponton, Grantham.

N.M.C.F.U. (Wolverhampton).

Forty-two members participated in the gymkhana held recently by this club at Burnhill Green, near Wolverhampton. The weather was ideal, and a most enjoyable afternoon was spent, tea being provided at the Dartmouth Arms Hotel.

Warrington M.C.C.

On Saturday a reliability trial will be held for the "Melbourne" challenge bowl over a course approximately 180 miles in length. All classes of motor vehicles up to 1,500 c.c. are eligible to compete in this event, which is open to anyone becoming a member of the club.

Amersham, Chesham and District M.C.C.

We are asked to state that a motor cycling club has been formed to be known as the Amersham, Chesham and District M.C.C., and the secretary, Mr. V. Goodwin, Heath House, Hyde Heath, Amersham, will be glad to hear from motor cyclists who are interested.

Northern M.C.

A very successful flexibility hill-climb was held recently at Rothbury, the results being as follow: 500 c.c. solo class, S. Bell (3 A.B.C.). Sidecar class, A. Stothard (7-9 Harley-Davidson sc.). Unlimited solo class, S. Bell (3 A.B.C.). The fastest climb was made by J. Orde (3½ N.U.T.).

Luton and South Beds A.C.

The results of the reliability trial to York and back, held recently, were as follow: Green Cup and gold medal, H. A. Reyre (5-6 James sc.). Gold medals, C. Bourley (3½ Sunbeam), R. Burley (4 Triumph), D. R. Gedge (Eric Campbell), G. Davison (3½ P. and M.), W. Furr (4 Triumph), L. Kell (2½ New Hudson), J. Wheeler (8 Royal Ruby sc.), N. Albon (2½ Levis), W. J. Cooper (5-6 Rudge), J. Simpson (2½ Hobart). Silver medals, J. E. Hill (3½ Rudge) and A. Swan (2½ New Imperial).

Rugby and District M.C.C.

A 100-mile non-stop reliability trial was held on the 20th ult. on a sporting course of 33½ miles, covered three times.

Results: 1st (silver cup presented by Mr. L. C. G. M. le Champion), M. Foxley (7-9 Indian); 2nd (bronze medal), J. S. Turner (6 A.J.S.); 3rd (bronze medal), F. J. Askham (3¾ Scott); 4th (bronze medal), A. H. Hydes (4½ Quadrant). Special prizes: H. J. Bennet (3½ Peugeot), silver cup for most sporting performance on fixed gear; A. W. Webb, silver medal for fastest ascent of Newnham.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Larger Belt Raises Gear.

I shall be pleased if you will answer the following queries: (1.) Does a larger belt alter the gear ratio? (2.) If so, why?—J.D.K.

(1.) The fitting of a larger belt raises the gear. (2.) If you care to work out the figures yourself, the reason for this is obvious. Supposing you have two pulleys of 6in. and 18in. diameter respectively, for a ½in. belt, the gear ratio will be 3 to 1. If you now fit a larger belt on to these pulleys, so that it stands ¼in. higher in the groove, the effective diameter of each pulley will be increased by ½in., consequently the gear ratio will be in the proportion of 18½ to 6½, or 2.92 to 1.

Irregular Running.

I have a 1912 5 h.p. A.J.S. combination which has been recently overhauled and pronounced "perfect," but after a short journey the following troubles were noticed: (1.) The machine is very hard to start, often requiring fifteen minutes' kicking before anything happens. There is a good fat spark, and the petrol seems to reach the engine all right. When the garage is darkened I noticed sparking all over the frame, chiefly the magneto lever on the tank and the gear lever. (2.) I replaced the old Amac carburetter with a 1920 one of the same make; but, contrary to expectations, the machine does not go slowly at all. With the old one the engine did go fairly slowly, but now it will not. We cannot find any air leaks. What number jet do you recommend? On the old carburetter a No. 29 jet was used, and we have tried Nos. 27, 29, 30, and 32, but there is very little difference. The one supplied was No. 30, so I have kept that one in.—G.J.

(1.) There is, apparently, some defect in the magneto, but without inspection we are unable to tell you what is the exact cause of the trouble. It would be advisable to forward it for repair to a reliable firm of magneto specialists. (2.) If the original carburetter gave satisfactory results, it would have been better to retain it rather than experiment with a new one. The fact that the engine will not run slowly on the new carburetter may be due to air leaks at the induction pipe joints, or to an excess of air through the carburetter itself. You should study the carburetter makers' book of instructions. No. 30 is about the correct size of jet for the old carburetter.

Scott Gear Adjustment.

I shall be much obliged if you will kindly give me information on the following points relative to the Scott gear. (1.) After replacing the gear recently, I found that the hollow bolt, which holds the gear in position on the left-hand (low gear) side, worked loose when the machine was run. What is the reason of this, and how can it be prevented? (2.) What means are there of keeping the left-hand (low gear) hub cone in adjustment? It is easy to adjust the cone, but what is there to prevent the adjustment altering? It seems to me, for instance, that screwing up the hollow bolt must cause the distance washer to bear against the cone and tend to tighten the latter.—W.H.

(1.) There is no reason why the hollow bolt of the Scott gear should work loose if it is properly tightened up. (2.) This bolt, when screwed up, causes the distance washer to press against the left-hand cone (which should be screwed up to the end of its thread), and, in doing so, holds it in place. In thus bearing against the cone the latter cannot be tightened unless it is very loose on its thread.

A Question of Contract.

When at the Show last November, I placed an order through an agent for a 2¾ h.p. two-stroke. The price and delivery date were stated on the receipt for my deposit of £5, bearing the signature of the agent, and I insisted at the time that the price quoted should be shown. I notice these machines are now advertised at a higher figure. Can I now insist on receiving machine at the original price?—F.C.C.

You can insist upon delivery of the machine at the price arranged, or in the event of failure to deliver, can sue for the difference in the price arranged and the present market price, unless in any contract or any order signed by the agent or acceptance there was a provision inserted showing that the price might be altered.

THE T.T. VICTOR.

T. C. de la Hay appeared not to be distressed in the slightest after his 226½ mile ride at a speed of 51.79 m.p.h. He is shown walking in after the race.

Belt Alignment.

I have a 90 mm. bore twin J.A.P. engine, to which I want to fit a Philipson pulley. This engine has ball bearings one side, and the crank case, therefore, has a large boss on it. It is probable that the most recessed model of the pulley will not give the correct belt line. This does not seem an important point on a Zenith or with an ordinary adjustable pulley, where no lateral compensation is possible for change of gear, and I would like you to tell me the greatest reasonable distance that the engine pulley may be set to the side. I intend the machine for colonial work, and not for speed trials. I do not consider belt wear a serious drawback.—N.V.O.

We think you will find that the Philipson pulley is not made to suit engines with a large crank case boss. In order to bring the belt into line, however, you might set over the engine in the frame by removing a part of the crank case lugs, and replacing with distance pieces on the side nearest the pulley. You could set the engine from $\frac{3}{8}$in. to $\frac{5}{8}$in. off the centre. The belt itself should be in perfect alignment on top gear.

Retarded Ignition.

My Indian motor cycle is a 1914 7-9 h.p. two-speed model, with the makers' carburetter. Timing as follows: Inlet, opens dead centre top, closes about $\frac{3}{4}$in. after bottom of stroke. Spark occurs at the top of the stroke when fully advanced; and the machine is run thus: the exhaust valve opens about $\frac{3}{4}$in. before bottom of firing stroke, and closes at the top. Engine takes very little air; air slide open about $\frac{1}{8}$in. When throttle is opened more than one-third, there is a blow-back through the carburetter. By shorting each plug alternately: front cylinder runs strongly—back, very weakly. Same obtains on changing plugs and leads. When assembled: compression good, drags back wheel, and can only be turned over on stand with difficulty. But, on removing plug and compression tap from each cylinder, alternately, the other cylinder has no compression. Valves do not stick and the induction pipe is well bound with insulation tape. New washers have been fitted in the inlet domes. Small discharge pipe, just behind sprocket on left-hand side crank case, is missing. Oil blows out; but does this affect running in any way? I think I have mentioned everything which might cause the trouble—and, incidentally, what I have done to trace it.—C.H.G.

The valve timing of your engine appears to be correct, but the ignition timing is far too much retarded. The spark should occur when the piston is 8 mm. from the top of the compression stroke, with the control fully advanced. Blow-back through the carburetter suggests a weak mixture, and this is borne out by the fact that very little extra air can be taken. It would appear, therefore, that the main jet is too small. The difference in power, between the front and back cylinders, may be due to air leaks, either in the induction system, or at the valve stem guides. The running will not be affected by the crank case relief pipe being removed. We cannot account for the fact that you get no compression in one cylinder when the plug is removed from the other one, and *vice versa*.

Gear too High.

My machine is a 4 h.p. single-cylinder with coachbuilt sidecar, and although the engine is in good order it will not pull on high gear. I fitted the three-speed gear myself, and I have a 20 T engine sprocket driving a 30 T sprocket on the countershaft. The pulleys are $7\frac{1}{2}$in. and $17\frac{1}{2}$in. diameter respectively. My own opinion is that a 14 T sprocket on the engine-shaft would be better, as I think the gear is too high.—H.W.H.

The present top gear is much too high and it is unreasonable to expect satisfactory running on it. A 14 T sprocket will bring the top gear down to $5\frac{1}{4}$ to 1 approximately, which, as you suppose, should be about right for an engine of 4 h.p.

Erecting a Shed.

About a year ago I erected a wooden motor shed at the back of my house. I have now received an order from the City Building Surveyor to take down and remove it within fourteen days. I would like to ask (1) if I am forced to do this, (2) also what steps the authorities can take if I do not, and (3) what the Ministry of Health's new regulations are in respect to these buildings?—W.S.

You should consult a solicitor or an architect in your town in order to ascertain what the local byelaws are, but no doubt you had no right to erect the shed without having a plan passed or obtaining the consent of the City Building Surveyor. If you have done this, you will be liable to penalties and also to remove the shed, and will certainly be prosecuted if you ignore the Surveyor's letter. With regard to the last paragraph of your letter, we do not think it is a question so much of the Ministry of Health's regulations as the local byelaws. The Ministry of Health would be more concerned with houses than with motor sheds.

Two-stroke Lubrication.

I shall be very glad if you can help me out of the following difficulty. I have a $2\frac{3}{4}$ h.p. O.K. two-speed two-stroke, and am using the petroil system of lubrication, half pint Vacuum T.T. to one gallon of petrol, Senspray carburetter, No. 40 jet. The engine is four-stroking at all speeds, irrespective of the position of air and throttle levers. (1.) Is the fault in the jet being too large and causing too rich a mixture, as the lubrication seems correct? (2.) Does the petroil system make the engine more difficult to start from cold? (3.) As a separate oil tank with drip feed is fitted, should you advise me to use this in preference to the petroil system, or is the latter the most satisfactory method of oiling two-strokes?—R.P.M.

(1.) The jet is certainly too large; try a 28 or 30. (2.) The engine should not be difficult to start, even though lubricated by the petroil system. (3.) If a separate lubrication system is fitted, we should recommend you to use it.

IMPORTANT DATES.

Sat., July 3rd—
First B.M.C.R.C. Open Meeting at Brooklands.

Sat., July 3rd—
East Lancashire Open Hill climb.

Mon., July 5th, to Sat., July 10th—
Scottish Six Days Trial.

Wed., July 7th—
Union Motocyclist de France et Automobile Club de l'Ouest, Grand Prix Race for Motor Cycles and Cycle Cars.

Wed. and Thurs., July 7th and 8th—
Arbuthnot Trophy Trial.

Thurs., July 15th—
Essex M.C. Joint Open Speed Trials, Westcliff-on Sea.

Thurs., July 15th, and Fri., July 16th—
Irish End-to-end Trial

Sat., July 17th—
Cumberland County M.C.C. Open Reliability Trial.

Sat., July 24th—
Luton and South Beds. A.C. Open Trial at Luton Hoo.

Sun., July 25th, to Aug. 1st—
International Six Days Trial in France.

Sun., Aug. 1st, to Wed., Aug. 4th—
Anglo-Dutch Trial in Holland.

Sat., Aug. 7th—
S.A.C.U. Inter club Meet at Callander.

Mon., Aug. 23rd, to Sat., Aug. 28th—
A.C.U. Six Days Trial.

Sat., Sept. 4th—
Scottish Speed Championships at St. Andrews.
Scott Trial in Yorkshire.

Nov. 29th Dec. 4th—
Olympia Show.

RECOMMENDED ROUTES.

MALVERN TO YORK.—G.B.L.

Malvern, Worcester, Alcester, Stratford-on-Avon, Wellesbourne, Southam, Dunchurch, Rugby, Lutterworth, Leicester, Newark, Tuxford, Retford, Bawtry, Doncaster, Askern, Selby, York.

WIMBLEDON TO LLANBERIS.—B.S.

Wimbledon, Hammersmith, Knightsbridge, Marble Arch, Edgware Road, St. Albans, Dunstable, Fenny Stratford, Stony Stratford, Towcester, Weedon, Daventry, Ashby, Kilsby, Watling Street, Webtoft, Atherstone, Faseley, Weeford, Gailey, Crackley, Bank, Atcham, Shrewsbury, Oswestry, Llangollen, Corwen, Cerrig-y-Druidion, Pentre Voelas, Bettws-y-Coed, Capel Curig, Pen-y-Grwyd, Llanberis.

WORTHING TO KESWICK.—A.C.A.

Worthing, Washington, Ashing, Billingshurst, Five Oaks, Cranleigh, Guildford, Ottershaw, Chertsey, Staines, Colnbrook, Slough, Beaconsfield, Amersham, Chesham, Bovingdon, Boxmoor, Hemel Hempsted, Redbourn, Harpenden, Luton, Stopsley, Hitchin, Baldock, Biggleswade, Sandy, Tempsford, Eaton Socon, Buckden, Stilton, Stamford, Grantham, Great Gonerby, Newark, Tuxford, East Retford, Bawtry, Doncaster, Wentbridge, Ferrybridge, Brotherton, Micklefield, Aberford, Bramham Collingham, Harewood, Otley, Ilkley, Skipton, Cargrave, Settle, Clapham, Ingleton, Kirkby Lonsdale, Kendal, Crook, Bowness, Windermere, Ambleside, Rydal, Grasmere, Dunmail Raise, Thirlmere, Keswick.

The Show.

November 29th to December 4th are the dates decided upon for this year's Olympia Motor Cycle Show.

Death of Lady Doctor.

Dr. Ethel Mordaunt, M.D., of Bromley, met with a fatal accident while riding a scooter. The lady was an experienced motor cyclist and car driver.

I.O.M. Charities.

During the T.T. week Messrs. Alec S. Ross, F. Olai, F. de Veulle, and D. J. Lynott collected by various means £272 11s. for Nobles Hospital, Douglas.

The Scottish Six Days Trial.

The popular annual Six Days event, organised by the Edinburgh M.C., starts from Perth next Monday. Over a hundred competitors are entered.

British Plugs.

Apropos the correspondence which has appeared in our pages concerning sparking plugs, it is interesting to know that, although German plugs predominated in the 1914 races, the British article was used with success this year. Lodge plugs were used in the winning Sunbeam and A.J.S. machines, and we understand that they were in no way "special," but supplied in the ordinary way of business. As a matter of fact, de lay Hay assured us that the plug he used in the race was the one with which he originally commenced practising.

The A.C.U. Six Days Trials.

So successful were the Ilkley Motor Cycle and Light Car Club in planning a route for their open reliability trial a few weeks ago, that they have been consulted by Mr. T. W. Loughborough, the Secretary of the Auto-Cycle Union, with regard to routes for the Six Days Trial. Darlington is to be the centre this year, and a number of routes have been suggested by the North Eastern A.A. The Ilkley club officials have submitted a selection of routes to Mr. Loughborough, and these are of an even more remarkable nature than the one which the Ilkley club outlined for their own trial. If these routes are accepted, which we understand is not at all improbable, then the competitors in the Six Days Trial are promised such a test as they have not before experienced.

Police Activity.

A correspondent informs us that the police are working a trap in the Palatine Road, between Barlow Moor Road and Northenden Bridge. The surface on this stretch is in excellent condition, tempting motorists to exceed the speed limit.

Birmingham Service Motor Cyclists' Trophy.

Readers may remember the excellent "welcome home" organised by Birmingham motor cyclists for their *confrères* who "went to the war." The committee have a balance in hand of £104 7s., £100 of which is to be used to purchase a perpetual trophy for open competition by teams of motor cyclists from the whole of the United Kingdom. The Birmingham and district motor cycling clubs have been invited to co-operate in an annual trial for the trophy. The balance of £4 7s. has been sent to the Isle of Man Hospital.

Another A.A. Roadside Benzole Supply Station.

The second of a series of benzole roadside supply stations to be provided by the Automobile Association was formally opened on Tuesday last, at Coombe Hill, at the junction of the Cheltenham Road with the main road from Tewkesbury to Gloucester.

The other supply station referred to is at Aldermaston on the Bath Road, between Reading and Newbury.

Special Features.

THE M.C.C. TEAM TRIAL.
IMPRESSIONS OF THE T.T.
A WEEK IN THE ISLAND.

Scottish Competition Rider's Accident.

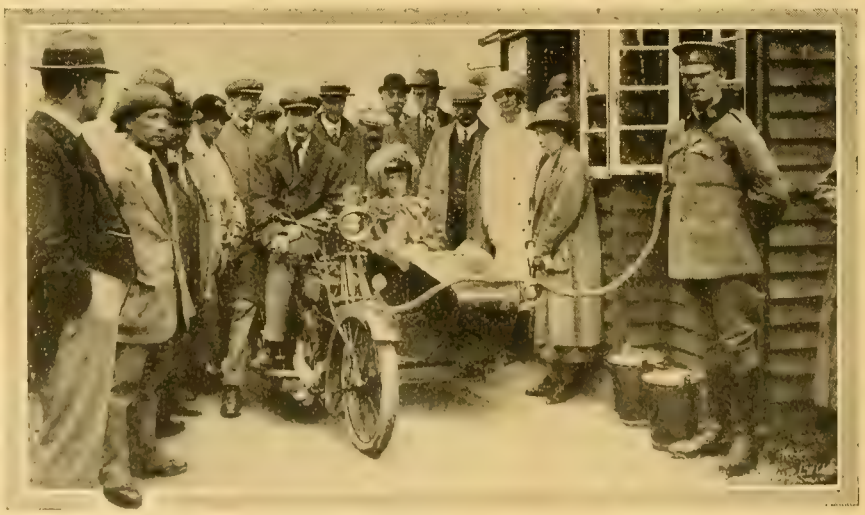
We regret to report that the well known Scottish competition rider and Norton exponent, Mr. Claude Duncan, recently met with an accident near North Berwick. Duncan will not, therefore, ride in the Scottish Six Days.

To Encourage Cheaper Fuel.

To encourage the use of cheaper fuel the R.A.C. (the parent body of the A.C.U.) has under consideration a trial of vaporisers and other apparatus by which internal combustion engines may be operated with alcohol and heavy oils, other than petroleum spirit or benzole.

Olympia Aero Exhibition.

All types of fighting and commercial aeroplanes will be seen at the forthcoming Olympia Aero Exhibition, which will be held from the 9th to the 20th inst. The exhibits will include flying limousines, amphibious aeroplanes, fireproof planes, and numerous types of engines and machines from the tiny 40 h.p. "baby" to the giant 1,400 h.p. 'bus capable of carrying a tremendous weight. The exhibition will be open on the 9th from 2 p.m. to 9 p.m., thereafter daily from 10 a.m. to 9 p.m. until the 20th.



Fuel supply stations are still few and far between in this country, although in America and on the Continent they are commonly met with. The photograph shows an Enfield outfit at the benzole supply station at Coombe Hill, on the Tewkesbury-Cheltenham road, the second to be installed by the A.A.

WOLVERHAMPTON HONOURS THE T.T. WINNERS.

A civic reception was accorded to Cyril Williams and T. C. de la Hay at Wolverhampton last week in honour of their success in the T.T. races on A.J.S. and Sunbeam machines respectively. Both winners are natives of Wolverhampton, the winning machines, too, were made in the town. Williams is seen in the centre facing the photographer, and de la Hay on the right.

Anglo-Dutch Trial.

From Dutch sources we learn that the date of the Anglo-Dutch Trial has been changed to Saturday, August 7th.

E. Lancs, Open Hill-climb.

The East Lancashire M.C.C. are holding their open hill-climb on the Newton side of Waddington Fells, near Clitheroe, on Saturday. The event starts at 1 p.m.

The Humber Trial.

The employees of the Humber works held their second annual trial last Saturday, over fifty competitors taking part. Our observations on this event will be in next week's issue.

Late Entries in Scottish Trials.

In addition to the eighty-six competitors given in last week's issue, the following are also riding in the Scottish Six Days starting from Perth next Monday :

Geo. W. Lush (3 A.B.C.)
S. Hubbard (2¾ H.B.)
A. Lowe (2¾ Calthorpe)
Barnet Gold (2¾ Wolf)
Rex G. Mundy (Reading Standard)
W. McLelland, jun. (4 Norton)
E. E. Palmer (3 A.B.C.)
E. Porter (3 A.B.C.)
Leslie Guy (3¾ Scott)
C. P. Wood (3¾ Scott)
Norman Black (3½ Norton)

Found.

Mr. G. Northover, a Zenith owner, of Little Court, Batheaston, Som., has a pair of pliers belonging to a Triumph rider, who helped him on the Wiltshire Downs on the 12th ult.

At Enfield recently Mr. C. N. Hay, of 43, St. Hilda's Road, Stoke Newington, picked up an aluminium dome or dust cover apparently off a Triumph.

The organising secretary of the M.C.C. Team Trial (Mr. B. Allan Hill, 1, The Homesteads, St. James Lane, Muswell Hill, N.10) has a tobacco pouch picked up on the course.

Race Meeting Postponed.

At the time of going to press, we hear that the B.M.C.R.C. race meet fixed for Saturday has been postponed until the 7th of August.

A Tip for Holiday Makers.

Many motor cyclists in going to the coast send their luggage by rail "to be called for"; we wish to warn readers against the danger of losing such luggage. A member of the staff sent his luggage on this way, and thieves, using his name, called for the luggage, and the railway company repudiated responsibility.

Obstruction by Char-a-banc.

In fining a char-à-banc driver for road obstruction at Macclesfield the other day, the Chairman observed that there seemed to be such a lot of chars-à-bancs on the road to-day that they appeared to be monopolising the highway, and the bench intended to put a stop to the practice of char-à-banc drivers preventing other cars from passing.

Ariel Works Staff Trial.

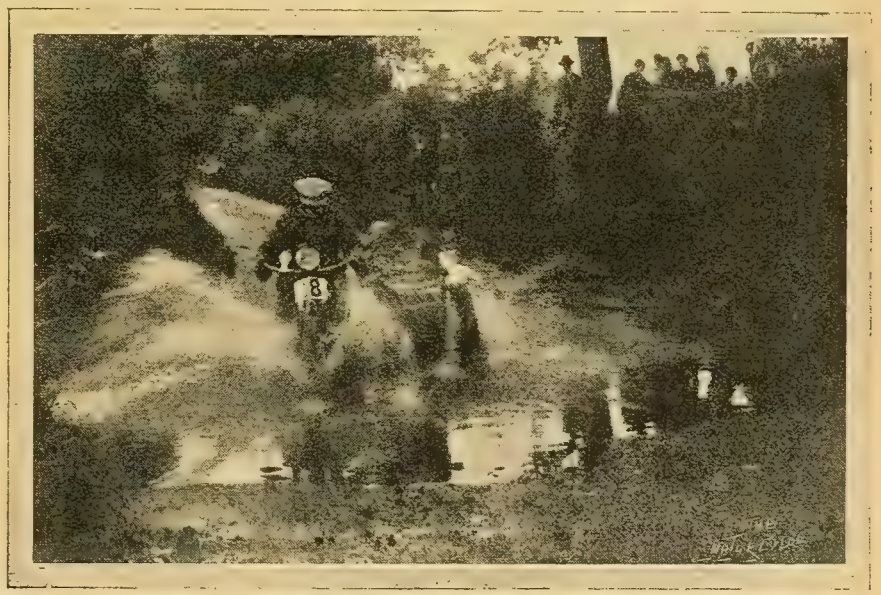
Eighteen employees of Ariel Works, Ltd., competed in the staff trial organised by works recreation club, which proved to be a very sporting affair. All competitors were novices, no one who had previously won a prize being allowed to compete. H. Hughes (3½ Ariel sc.) proved to be the winner, and F. Deeley (3½ Ariel) and H. Betteridge (6-7 J.A.P.) tied for second place. The course was almost eighty miles in length.

Innovations in the 1920 Six Days.

The first four days of the A.C.U. Six Days Trial (August 23rd to 28th) will be run from Darlington; on the fifth and sixth day the competitors will ride southward to Brooklands, where a half hour speed trial will be held. A brake test will be held on the test hill at Brooklands, and flexibility and acceleration tests introduced last year will not be included.

Arbuthnot Trophy Trial.

The Naval Trial for the Arbuthnot Memorial Trophy, which will be held in the Home Counties next Wednesday and Thursday, has attracted an entry of twenty-one. The start is from Purley at 10 a.m., and the course for the first day includes Brasted, Westerham, and other well known hills in this district, the luncheon stop being Reigate. On the second day a similar hilly course has been planned, finishing at Brooklands Track.



AN EMPLOYEES' TRIAL. Ariel Works, Ltd., is the latest motor cycle firm to organise a trial for its employees. The illustration shows one of the competitors negotiating a watersplash.

South Birmingham M.C.C. the Club Champions of 1920. Four Complete Teams Finish the Course.

NO fewer than twenty-eight teams, representing clubs from all over England and Wales, fought for the honour of club champions last Saturday. The contest was the thirteenth of the kind organised by the Motor Cycling Club for *The Motor Cycle* Challenge Cup.

From all parts of the kingdom motor cyclists converged on Tring, the starting point, the course used being the same as last year, and including several single figure gradients with loose surfaces, and measuring slightly less than thirty-three miles. This circuit was covered three times, the competitors thus filing past the timekeepers, Messrs. F. T. Bidlake and G. J. M. Walker at the completion of each round.

The contest was fought out with particular keenness indeed, the enthusiasm appears to grow apace as the years roll by. Starting first at 1 p.m. was the Coventry and Warwickshire Motor Club team, the holders of the trophy, followed by the Motor Cycling Club. These clubs each hold two shares in the present trophy, and a win by either of them would have resulted in the trophy being won outright. But trouble befell one member of each of these two teams very early in the trial.

At the end of the first round seventeen complete teams were in the running for the cup, which number was reduced to eleven on the second circuit, and further stops resulted in four teams completing the course of approximately 100 miles without a single stop. The clubs claiming this honour are undernoted in order of merit, the final classification being arrived at by adding the variation of each rider's times, the most consistent running naturally scoring. They were the—

	Total deviation. m. s.
South Birmingham M.C.C. ...	**14 54**
Leicester and District M.C.C. ...	**15 10**
Surbiton and District M.C.C. ...	**19 47**
Worcester and District M.C.C. ...	**22 32**

Midland clubs, as will be seen, scored heavily, and there will be great rejoicing this week in Birmingham motor cycling circles since the South Birmingham organisation is comparatively new.

Excellent Organisation.

The long line of riders at the starting point formed an impressive spectacle, but confusion was entirely absent, as is usually the case in M.C.C. events, which are notable for their excellent organisation. Mr. B. Alan Hill, the trials hon. sec., may here be congratulated on receiving such an excellent entry, and for the management of the trial generally.

Among the riders were the *élite* of the motor cycling fraternity. T. C. de la Hay, the Senior T.T. winner, was one of the successful Worcester non-stop team. G. Dance (Sunbeam), who made the fastest laps in the Isle of Man the previous week, formed one of the Wolverhampton team, and J. A. Watson Bourne, this time on an Ariel, rode in the Sutton Coldfield A.C. team. Other T.T. men were Eric Williams, Le Vack, F. A. Applebee, Harry Collier, and Noel Brown. Together with most of the leading riders in reliability trials, it will be appreciated that those contesting the honour of club champions were in every sense worthy of the claim. F. W. Applebee was this time a looker on.

No. 1 man was Sam Wright (3½ Humber with Cox Atmos carburetter), captain of the Coventry team. A team trial would be incomplete without this well known rider, who has figured in the winning team more often than any other individual motor cyclist.

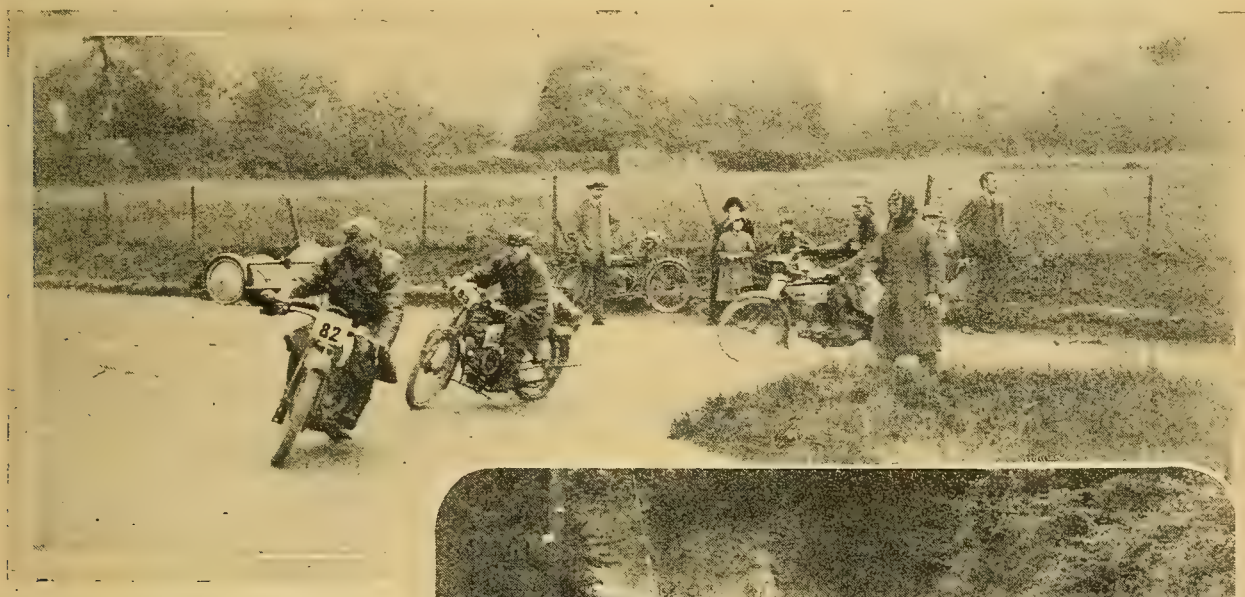
All the 286 competitors got away well except the Public Schools M.C.C. team, which did not mature, their places being taken by a late entry of the Gipsy M.C.C. with a very strong team composed of A. F. Selby and A. S. Guthrie on Sunbeams, H. le Vack (3½ Duzmo), J. A. Masters (Harley-Davidson sc.), S. R. Axford (7 Indian sc.) and E. M. Oliver (4 Norton sc.).

Of troubles *en route* there were many. That was expected, but stops in the first few miles were not bargained upon.

On Aston Hill—six miles—R. E. Pugh, Sutton (2¼ Levis sc.), broke a chain; at a bend soon after the summit, T. R. Gibbins, Coventry (8 Acme sc.),

The Team Trial.

ran into a non-competitor's machine; W. H. Egginton, Birmingham (8 Sunbeam sc.), broke one of the new chains with which he had equipped his machine just to make sure! A. B. Chapman, Sheffield (Brough), sooted a plug at fourteen miles; S. R. Axford, Gipsy's (Indian sc.), punctured—likewise Lloyd (model 4 Triumph). And so the weeding out process continued. One wondered how the ten competitors with only one brake were faring on the steep descents around Dunsmore. After Dunsmore, the riders filed past the eastern entrance to Chequer's Court, the residence of the Prime Minister, turned left at Butler's Cross on to Princes Risborough, and left up Whiteleaf Hill, down Kop and up Pink Hill. Whiteleaf is quite steep and very rough on the right hand bend where the steepest gradient is encountered. Here, A. Wyatt, Norfolk (4 Douglas), stopped, and Noel Brown, Liverpool (4 Norton sc.), suffered from clutch slip—his machine was brand new and had not really been run in. On Pink Hill, L. Kell, Luton (New Hudson sc.), stopped, ran back a yard or two and restarted. The route, splendidly arrowed at every doubtful turn—thanks to Messrs. W. H. Wells and F. T. Bidlake, now led through Hampden Park to Kemble, where there was a sharp left turn just short of Missenden, and a turn right, *via* Lee, St. Leonard's, Cholesbury and Wiggington, down another steep hill and left again to the starting point.



F. A. Applebee (Indian-Scout) and F. Thorpe (2¾ Douglas), of the Essex M.C. team, and S. Crawley (4 h.p. Triumph), Bedford and District M.C., on the hairpin turn into the Missenden-Wendover road.

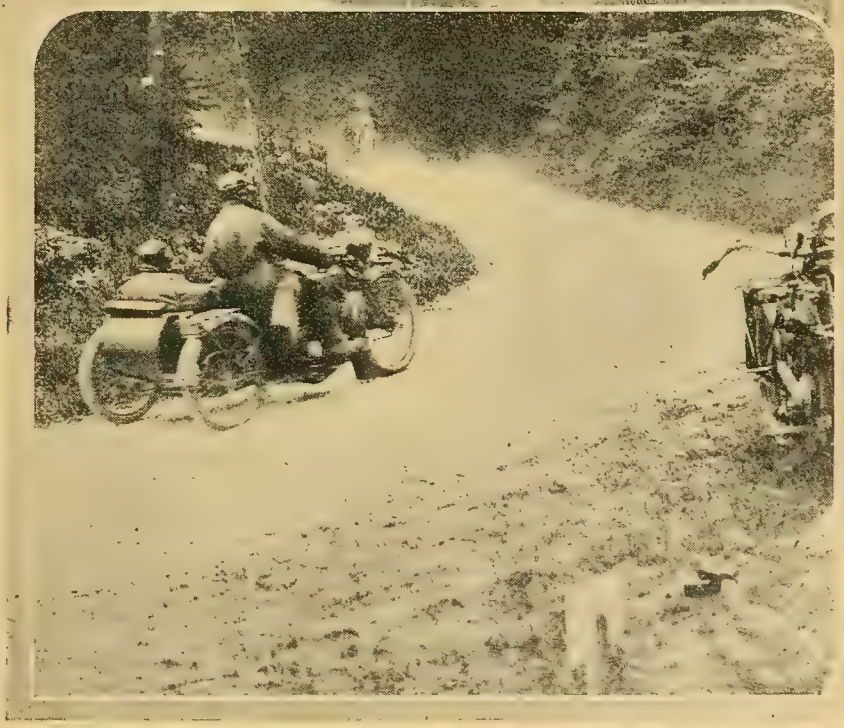
Non-stops on Punctured Tyres.

Keen to uphold their teams' record, the second lap saw one or two continuing on flat sidecar tyres, and quite a number gained non-stops by continuing when punctures occurred in the final lap. The hopes of the M.C.C. were dashed by T. S. Sharratt (Indian), unfortunately suffering a dry skid when going fast on the bend approaching Aston Hill. He, like Gibbins, of Coventry, and others remounted and continued, though the rules provide that any competitor stopping shall there and then withdraw. One rider who shall be nameless, clean baffled the numerous officials around the course, by passing on the first circuit with a flat tyre, and repassing next time with a hard tyre! The spectators imagined that the rider had accomplished a non-stop run, not so the wily observers! The Bedford team were unlucky in the second circuit. All the team, including Crawley, Hines, Collins, Cocker, Green and Rycroft, were riding 1920 model Triumphs, and made a great show on the hills, but Collins claims to have hit a cow which brought him down, but continuing he recorded a "traffic" stop on his card. The judges, however, decided that a traffic stop is something different from a traffic collision, and his mileage, therefore, counted to that point only. Ealing lost Tilt (Triumph) with a sooted plug, and the Blaenavon M.C.C. (Mon.) lost Evans (Matchless sc.) with a puncture on the second round.

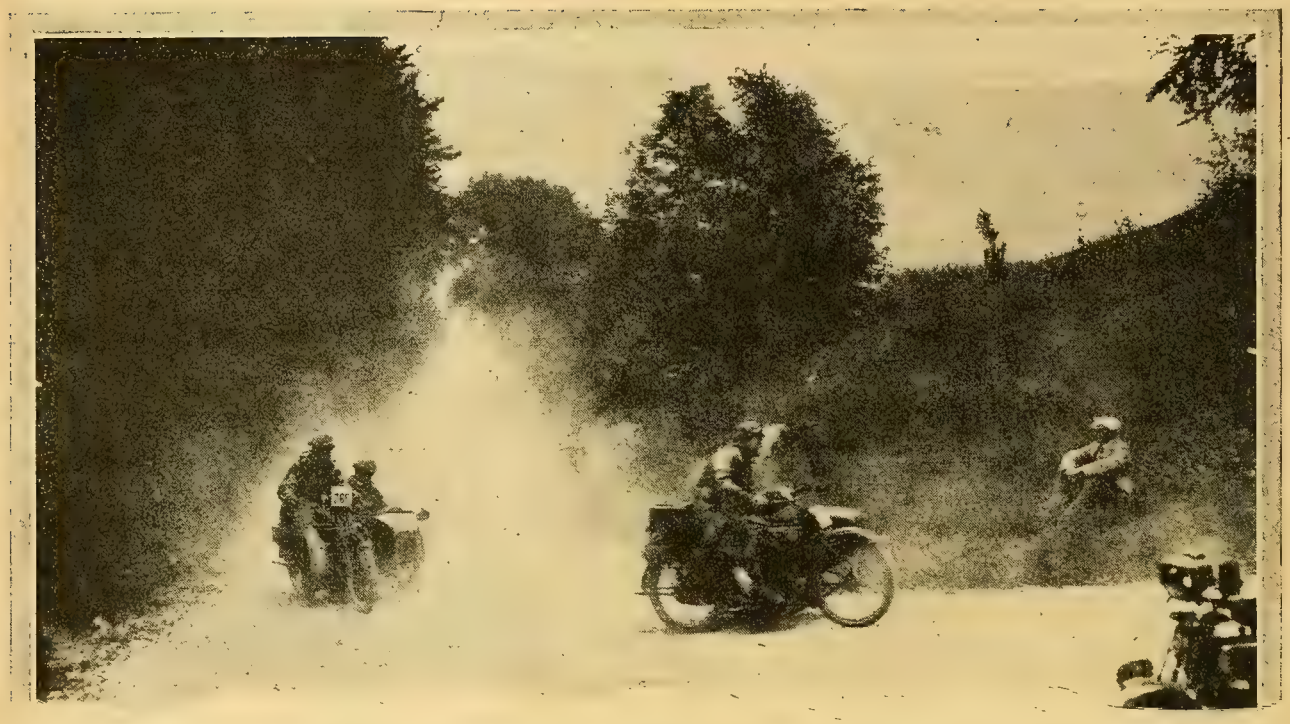
At intervals it rained slightly—quite an unusual experience on M.C.C. team trials, which have been invariably associated with sunshine and dust. Birmingham suffered a second stop, R. W. Duke, who has many team trials to his credit, stopping with a sooted plug following one of the many steep descents.

Four Seconds Variation.

The timekeepers reported remarkably regular running by many riders, who, no doubt, realised that more than one team would get home complete, necessitating



On Pink Hill. The steepest gradient immediately follows the bend depicted.



H. Poynton and E. Stobart, of the Sutton Coldfield and N. Birmingham A.C., both on James sidecars, on the bend of Pink Hill.

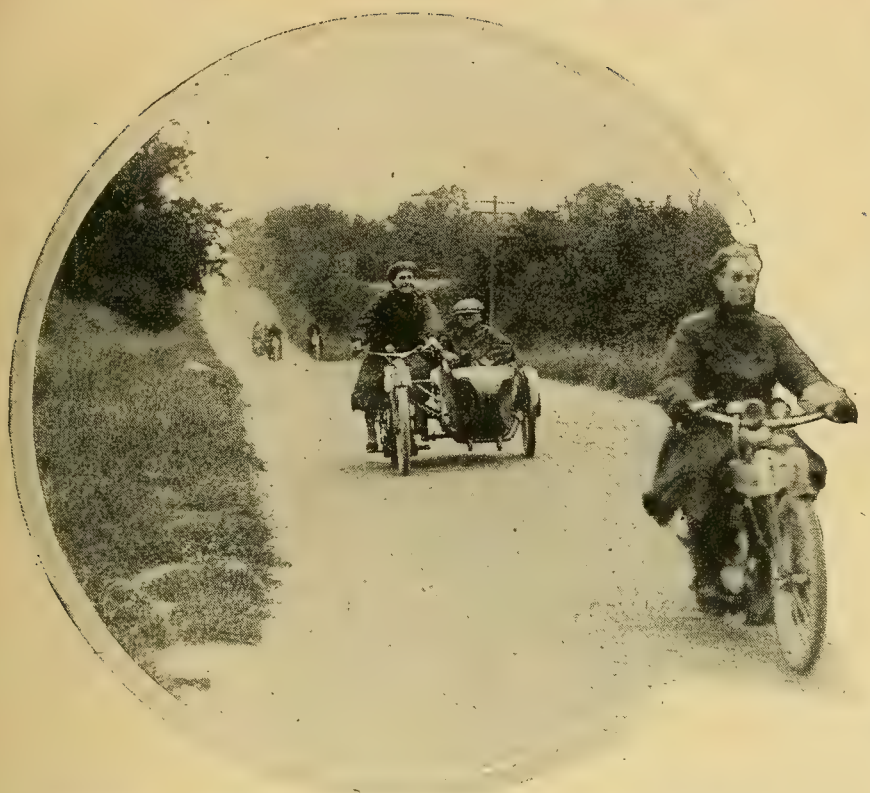
consideration of the regularity of lap times. E. A. Colliver, for instance, completed two laps in precisely the same time, and was but four seconds out on the other. As a team the Coventry club rode most regularly, all appearing to leave the timing to the leader of the van, the imperturbable Sam Wright. Harry Collier (Woolwich) stopped on Aston Hill due to a plug terminal moving and causing a short circuit with the induction pipe. Mundy (Surbiton) arrived with a flat sidecar tyre on his Martinsyde-Newman, and so enabled his team to finish intact bedecked in their picturesque blue tammies with tassels complete!

Symons, Rochester, and Giles (A.J.S.) also rode on with a flat back tyre.

As the finishing line was crossed and the team representatives were able to compare notes, it was amusing, yet sad! to observe the chagrin of teams of five to learn for the first time that the sixth man had retired. This happened in several instances, and the poor unfortunate had usually departed—home, crestfallen no doubt, but preferring not to await the "sympathies" of his colleagues!

The North London M.C.C. was another club which lost one man only, thanks to

(Left) A. B. Chapman (5-6 Brough sc.), Sheffield and Hallamshire M.C.C., leading F. W. Baker and P. W. White, of the Cambridge and District M.C.C., both on Sunbeam sidecars. (Right) Eric Williams (3½ Sunbeam sc.), of the Worcester team, passing F. A. Jelks (6 Zenith).



The Bedford and District M.C. team all rode Triumphs. Here they are seen near Aston with S. Crawley (solo) and J. Cocker (sidecar) in the foreground.

R. H. Baxter (2¼ Radco) completing the last fifteen miles on a flat back tyre after making clean ascents of all the test hills.

It was nearly eight o'clock when the last man arrived home, and an hour or so later the provisional results were issued showing that four teams had clean sheets, their positions being as follows:

Club Champions of 1920.

SOUTH BIRMINGHAM M.C.C.

Deviation on time, 14m. 54s.

B. Kershaw (2¾ Verus)
G. Denley (2¼ Velocette)
B. Bird (3½ B.S.A.)
H. Saddington (6 James sc.)
H. Uzzle (3½ B.S.A. sc.)
F. Walker (4 Triumph sc.)

The Runners Up.

Each team member accomplished a non-stop run.

LEICESTER AND DISTRICT M.C.C.

Deviation on time, 15m. 10s.

A. Wooding (4 Sunbeam)
J. Willcox (3½ Rudge)
W. C. Pym (4 Douglas)
Will Chapman (6 A.J.S. sc.)
R. Harris (4 Norton sc.)
H. Pole (8 Morgan c.c.)

SURBITON AND DISTRICT M.C.C.

Deviation on time, 19m. 47s.

R. G. Spikins (7-9 Harley-Davidson)
R. C. Staunton (4 Triumph)
L. T. Gilson (8 Zenith)
R. C. Charlsworth (8 Zenith sc.)
H. Jepson (8 Zenith sc.)
Rex Mundy (6 Martinsyde-Newman sc.)

WORCESTER AND DISTRICT M.C.C.

Deviation on time, 22m. 32s.

E. Williams (3½ Sunbeam sc.)
J. Westwood-Wills (2¾ Verus-Blackburne)
T. C. de la Hay (3½ Sunbeam)
J. A. Chadwick (2½ Diamond)
E. W. Choldcroft (6 A.J.S. sc.)
J. Dudley (3½ Sunbeam sc.)

The judges were Messrs. R. H. Head (appointed by the M.C.C.), W. Cooper (appointed by the A.C.U.), and Geoffrey Smith (appointed by the donors). The chief marshal was Major L. A. Baddeley, M.C.

NOTES ON THE TRIAL.

The same course as last year was employed. It was better observed than before, and each observer had an official number denoting the post at which he was on duty. It was an excellent idea and worked admirably. The arrowing was very well carried out.

Being mostly over by-roads the dust was trying at times, but later it was laid by occasional showers. This, by the way, is the first team trial of the fourteen previously held during which rain has fallen. The surface was pretty rough on most of the hills.

The start took place in Cow Lane, so we were told by a Tring policeman. Naturally there were no cows in this lane during the afternoon, but these animals were reported elsewhere on the course, and it was said that one prevented a club from finishing with a clean record.

Nine machines started without two independent brakes as required by law. These improperly equipped motor cycles, which are almost invariably ex-Government stock, may prove an expensive investment to those riders who have their defects noticed by promotion-seeking policemen.

Each rider carried a number card which also bore the abbreviated title of his club. Some were distinctly puzzling, and it required a few moments thought to recognise BLVN, and STN CLD. In fact a few Welsh entries might have caused serious trouble.

The weather, from the competitors' point of view, was ideal. There was just sufficient rain to keep down the dust—a big factor with 200 machines on a thirty-mile circuit.

The enormous popularity of the single was again demonstrated. Triumphs predominated: one club—Bedford and District—used them exclusively.

It was noticed that, despite their small tanks, none of the two-strokes carried extra fuel. On the other hand, the big single soloists almost to a man carried an extra quart or two—in receptacles ranging from a German water bottle to a half-gallon Vacuum tin. Auxiliary tanks were not much in favour.

Has the M.C.C. given up the idea of finding a more difficult course, and, as one unfortunate suggested, contented itself with "improving" last year's by the judicious use of some hundredweights of old nails?

One competitor caused some amusement by fixing his number to the sidecar *wheel*. From the distance it resembled a burst tyre sailing round—probably the true source of the rumour that a sidecar was carrying on in that state.

The Motor Cycle Challenge Cup—a Trophy coveted by all keen club men. The holders are regarded as the club champions for the year.

The Hour Record Broken.

67.93 Miles covered by J. L. Emerson on an A.B.C.

J. Emerson (A.B.C.), after establishing the new hour record at Brooklands. He covered 67.93 miles in the hour, beating G. E. Stanley's (Singer) 1912 record by 0.5 m.p.h

IT is well known that for some time past J. L. Emerson has been casting longing eyes upon the hour record. The previous distance of 67.44 miles per hour in the 500 c.c. class has stood to the credit of G. E. Stanley on a Singer since October 13th, 1912. On Saturday, the 12th ult., Emerson, mounted on a flat-twin A.B.C. motor cycle, attempted the record, and had actually completed nine laps at record speed when a severe thunderstorm occurred which put an end to any further riding that day. For three laps Emerson averaged a speed of 71.5 miles an hour.

A second attempt to capture the record was made immediately after the conclusion of the B.A.R.C. meeting on Saturday, the 19th ult. With Mr. A. V. Ebblewhite as timekeeper, Emerson at once began to reel off laps at a speed in excess of 70 miles an hour, but stopped on more than one occasion, so that eventually the distance traversed in the hour was reduced to 67.93 miles. Actually, his 400 c.c. machine is capable of a record in excess of the mileage with which he is credited, by reason of the unexpected stops which were experienced, and it is confidently expected that should any other racing motor cyclist beat the new figures, Emerson will make a further attempt to regain the coveted record.

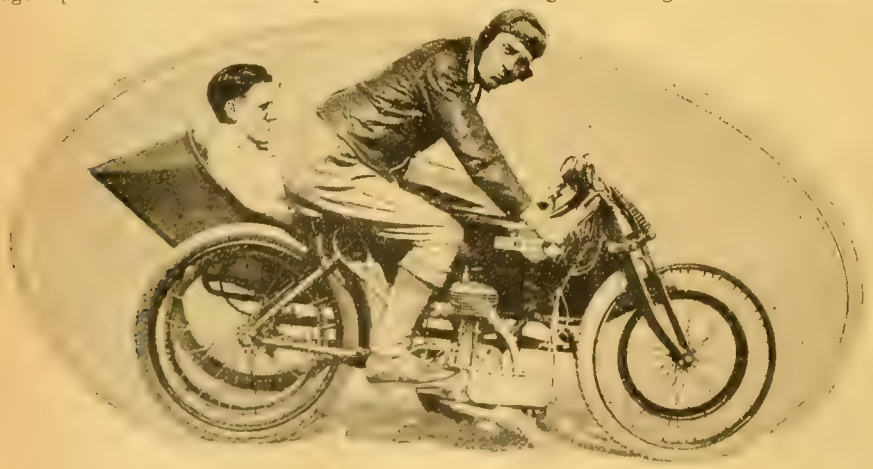
The A.B.C. machine was fitted with Palmer tyres, a C.A.V. magneto, Flexr carburetter (described in *The Motor Cycle* of April 15th, 1920, and made by Messrs. Jones and Marchant, 1, Baker Street, Weybridge), and Renold chains. He used Pratt's spirit and Wakefield's Castrol "R." This lubricant was also used by McNab (when he broke several long-distance records on a Wooler) and not the oil mentioned in the report.

Amateur Breaks Four Hour Sidecar Record.

42.62 Miles per Hour for Four Hours on a B.S.A.

AT 10 a.m. on Wednesday, June 23rd, Captain Maurice C. Breese, astride a 3½ h.p. B.S.A. and sidecar, made a successful attempt to break the four-hour record in class G for motor cycles and sidecars, the cylinder capacity of which does not exceed 500 c.c. The previous record was held by H. Riddell, on a Zenith-Green-Precision, whose average speed was 42.42 miles per hour. Captain Breese, who is an amateur rider, covered a distance of 170 miles 862 yards in four hours, at an average speed of 42.62 miles an hour. He had no less than twelve stops caused by an oily belt, whilst a twenty minutes halt was necessitated in the last hour by the same trouble. Special draught shields were fitted which, he states, aided considerably the cooling of his engine. These shields were made of thin sheet steel and placed in order to direct the air, on one side, over the exhaust pocket and, on the other, over the side of the cylinder. He completed one circuit at a speed of 50 m.p.h.

Amongst the equipment used was a special oil tank to provide increased capacity, whilst Wood-Milne tyres and belt, Cooke plugs, Wakefield Castrol oil, Shell spirit, and Middleton sidecar were employed.



42·62 M.P.H. WITH SIDECAR FOR FOUR HOURS.
On Wednesday, June 23rd, Capt. Maurice C. Breese broke the four-hour record in Class G, for sidecars under 500 c.c. capacity His average speed was 42·62 m.p.h.

RACING AT BROOKLANDS.

High Speeds in the 100 Mile Races. Four Records Broken.

The start of the All-comers' Handicap. This race was won by H. R. Harveyson (Indian).

THE 2¾ Blackburne followed up its success in the Junior T.T. by winning the 350 c.c. 100 miles race at Brooklands last Saturday. This event and the "Senior" race for a similar distance attracted the greatest interest at the B.M.C.R.C. meeting.

Eighteen riders faced the starter, Mr. A. V. Ebblewhite, for the former event.

From the start, E. B. Ware (N.U.T.-J.A.P.) and E. Kickham on his o.h.v. Douglas were well to the fore, whilst T. Eve (Matchless), whose performance is usually interesting, was not up to his previous form, but W. A. Jacobs (Singer) settled down in his usual manner for a steady and consistent speed.

Two Woolers were entered, one piloted by F. A. McNab, the recent long-distance record breaker, and the other ridden by J. F. Hall, who experienced trouble in the first lap and was delayed for a considerable time.

Ware and Kickham kept well in front of the field, but the latter halted towards the end of the second lap to effect repairs, and lost two circuits. These positions were again altered when Ware was forced to stop through rear wheel trouble. J. S. Holroyd (Blackburne) now gradually crept to the fore, and soon became the favourite.

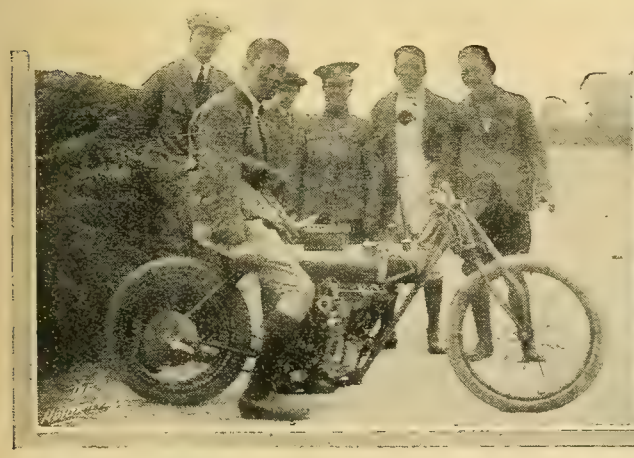
A Blackburne Success.

R. E. L. Saunders (Green-Precision) retired in the third lap. Tudor Thompson, whose Douglas had been missing badly, halted to fit a new plug in the nineteenth lap. These halts now left Holroyd, Eve, and Jacobs without serious competitors. Eve was, however, still slow, but Jacobs was lapping at high speed.

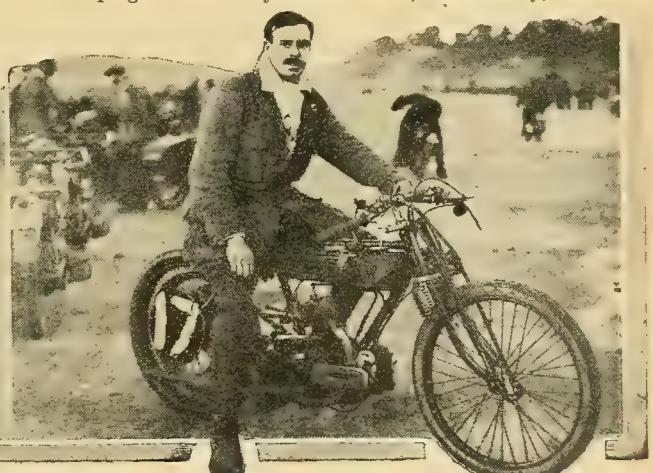
Holroyd, not having refilled his tank, had some distance in hand, and Eve's chance depended almost entirely upon the fact that the Blackburne would, sooner or later, require replenishments.

With only two laps to go the Blackburne halted. His machine was filled so quickly, however, that he still retained his leading position, and passed the finishing line amid cheers, the possessor of the five-guinea cup offered as first prize. His average speed was 52.88 m.p.h.

T. Eve secured second place, followed by Jacobs, who, incidentally, broke the



Major J. Woodhouse (Matchless-M.A.G.), after setting up a new 100 mile record in Class C.



J. S. Holroyd, who rode third in the Junior T.T., won the 350 c.c. 100 mile race at an average speed of 52.88 m.p.h.

Racing at Brooklands.—

following records: 100-mile in Class A, raising the previous record held by N. D. Sclatter on an Alcyon from 42.33 to 48.79 m.p.h.; his own one hour record, in which his speed was 49.47 m.p.h., as against 45.23 m.p.h.; and the two-hour, held by Sclatter, the speed being increased from 42.45 m.p.h. to 49.04 m.p.h.

J. Woodhouse (Matchless), E. Porter, and J. Emerson (A.B.C.) were well to the fore in the eighth lap. R. C. Chawner (Sunbeam), however, retired.

100 Miles "Senior T.T." Race.

The Senior event proved to be a most exciting race, in which there were fifteen competitors. V. Horsman (Norton) sustained a broken petrol pipe in the first lap, whilst S. L. Bailey's chain broke in the fourth.

H. R. Harveyson (Indian Scout) was making excellent speed, and as the laps were reeled off, it became clear that the race was in the hands of Woodhouse (Matchless), Emerson (A.B.C.), and Harveyson (Indian Scout).

In the twenty-fifth lap Woodhouse led Emerson, but a replenishment stop brought him level with the latter when starting away. Meanwhile Harveyson was still going well. The proximity of the riders and the strain of the distance covered prompted the question as to whether Emerson would be able to retain his speed and rob the Indian of the second place. The A.B.C. passed the grand stand with a flat tyre. Undaunted, Emerson pluckily carried on and passed the finishing line well ahead of Harveyson. Woodhouse (Matchless) finished first.

Class C Records Broken.

The fourth and fifth finishers, who with Emerson and Harveyson secured the club plaque, were G. S. Smith (B.S.A.) and Laurie Bailey (N.U.T.).

J. Woodhouse broke the 100 mile record in Class C, previously held by J. Emerson (Norton), whose speed was 64.27 m.p.h., and raised the speed to 69.58 m.p.h. He also secured the five guinea cup.

The All-comers' Handicap.

Other races on the programme included an All-comers' handicap for solo and sidecar machines which was run off in two heats. S. L. Bailey (Douglas) won the first, followed by J. Woodhouse (Matchless) and E. Porter (A.B.C.), while Harveyson (7-9 Indian), D. H. Davidson (Harley-Davidson), and E. Remington (Matchless-Jap) were first, second, and third in the second heat.

The final was obviously a match between Harveyson (Indian Scout) and Woodhouse (Matchless); the former winning, with Bailey third.

D. H. Davidson (Harley-Davidson sc.) won the Surbiton handicap at a speed of 52.84 m.p.h., R. Kaye Don (Norton) and Harry Martin (Matchless) being second and third respectively.

RACING ON THE FORESHORE.

The Southport A.C. Successful Speed Trials.

THE superiority of the small high efficiency engine over that of large cubic capacity for short speed events was again demonstrated last Saturday. At the speed trials organised by the Southport A.C., on the sands, two A.B.C. machines ran away from the field in all the solo events, beating in some cases those of 1,000 c.c.

Each time they got away smartly, and by rapid acceleration obtained such a lead that they crossed the line before the larger machines had got into their stride.

The course was a measured mile on the Foreshore, the sand being dry and firm, though rather uneven. Ropes on either side prevented the large crowd of spectators from pushing forward in their endeavour to get a better view.

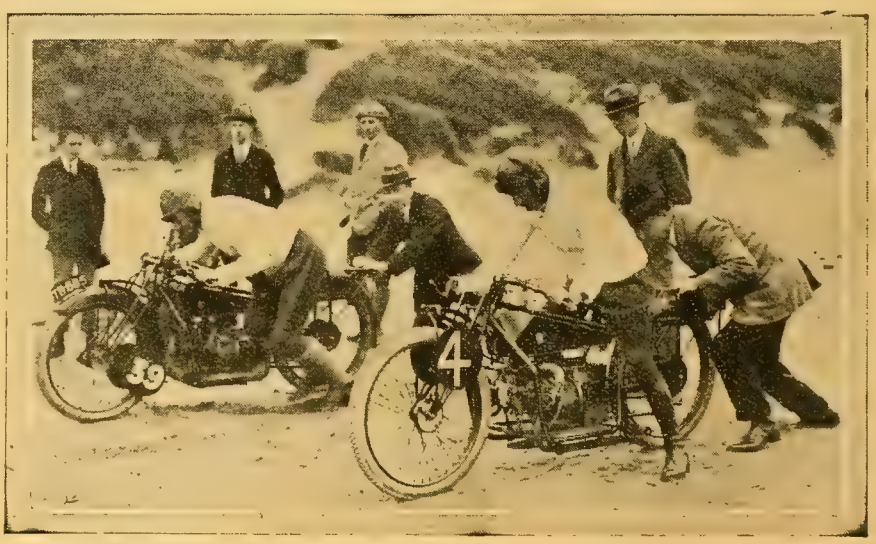
Good entries were received for the various classes, the majority of which were eliminated in the preliminary heats, leaving a mere handful of men to contest the finals.

Close Racing.

Quite the most spectacular performance was put up by the two A.B.C.'s ridden by Whalley and Russell King. During one of the heats they came roaring down the course side by side; the machines might have been joined together so close were they to each other. They kept dead level until the last few yards, when Whalley just managed to pull ahead.

H. Mason, who was second in class 3 and fourth in class 4, was astride the T.T. Norton, ridden in the Senior T.T. by V. Olsson. His best time for the mile was 1m. 8⅘s., while O. Carter, winner of the sidecar event, rode a machine built by himself and fitted with a 3½ h.p. o.h.v. J.A.P. engine.

An unfortunate accident, which marred an otherwise enjoyable afternoon's sport, occurred during the unlimited solo heats. J. Taylor, riding a big Harley-Davidson, got into soft sand soon after starting, and falling heavily sustained injuries to the face. P. C. Hoyle (Zenith), who was following, pulled up immediately and went to the injured rider's assistance, the latter being eventually conveyed by car to hospital. His injuries, however, were not nearly so severe as they first appeared.



The two A.B.C. riders, who between them won the three solo events, which was a neck and neck race to the finish

The Scooter Race.

Four entries were received for the scooter race, though only two faced the starter, these being J. Critchley (Mobile Pup) and H. Morris (Kingsbury). The event, which amused the crowd considerably, proved an easy victory for Critchley, who won by several hundred yards. The fastest time of the day was made by Whalley (3 A.B.C.), who covered the mile from a standing start in 1 min. 5⅖ secs., averaging 56.5 m.p.h. He rode very consistently throughout the meeting, his total variation in times being only 1⅕ secs.

The results were as follow:

CLASS 3.—Solo, 500 c.c.
1. H. Russell King (3 A.B.C.)
2. H. Mason (3½ Norton)
3. F. Collard (3½ Rudge Multi)
Time, 1m. 6⅘s. Speed, 54 m.p.h.

CLASS 4.—Solo, 750 c.c.
1. —. Whalley (3 A.B.C.)
2. H. Russell King (3 A.B.C.)
3. F. Collard (3½ Rudge Multi)
Time, 1m. 5⅗s. Speed, 56.5 m.p.h.

CLASS 5.—Solo, Unlimited.
1. —. Whalley (3 A.B.C.)
2. E. C. Ecroyd (4 Triumph)
3. F. Collard (3½ Rudge Multi)
Time, 1m. 6⅕s. Speed, 54.3 m.p.h.

CLASS 6.—Unlimited Sidecars on Formula.
1. O. Carter (3½ O.K.-J.A.P. sc.) .. 1m. 20⅗s.
2. W. S. Life (3 Zenith sc.) .. .. 1m. 19⅗s.
3. E. H. Clifton (7-9 Harley-Davidson sc.) .. .. 1m. 18⅘s.

CLASS 7.—Scooters.
1. J. Critchley (Mobile Pup)
2. H. Morris (Kingsbury)
Speed, 14 m.p.h.

Hark back to 1914—

Do you remember the T.T. Race which took place in that year?—Of course you do!

Possibly you remember, too, that the

1914 T.T. Winner was JOHN BULL BELTED

If your memory serves you so well—good. If it doesn't, we are here to remind you of the fact—to again recall the remarkable performance of Mr. C. G. Pullin (the winner) who covered the

225 miles at 50 m.p.h.

adding practically two miles per hour to the previous record.

Mr. Pullin established that record

without touching the John Bull Belt throughout the run.

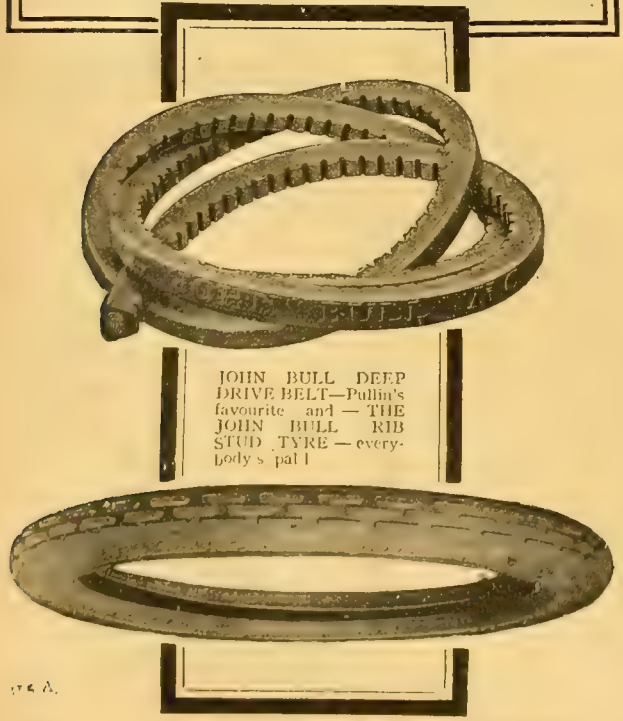
So much for the most excellent qualities of the John Bull Deep Drive Belt.

JOHN BULL TYRES

are just as good—they are capable of service second to none—and the man who rides them knows it too!

How about getting particulars from your agent?

THE LEICESTER RUBBER CO., LTD.,
LEICESTER



JOHN BULL DEEP DRIVE BELT—Pullin's favourite and — THE JOHN BULL RIB STUD TYRE — everybody's pal!

"Ixion" knows how to keep dry!

"Finally I bought a first-grade suit of grey oilskins made by Barbour, "of South Shields, and found I could ride my 200 miles of a trial, "stand in a steady downpour through two hill-climbs per diem, sit on wet "grass banks when my legs wearied, and get into the hotel at night bone-"dry; moreover, if the oilies were hung up overnight in a wall-less "stable for the draughts to play around them, they were invariably bone-"dry long before the first competitor got away next morning."

"Ixion," in his Occasional Comments—"The Motor Cycle."

Beacon Oilskins

Money back in full if they fail on any point.

NEVER GO STICKY OR LEAK.

The Beacon Motor Cycling Suit will keep you as dry as it does "Ixion," and will enable you to drive all day against wind-driven Rain and Sleet without letting you get wet or chilled.

No More Lightless Lamps!

The EVANS' "Stillalite" Single Burner, 3/9.

EVANS' "Stillalite" Emergency Lights for Motor Lamps make carbide and oil lamps give forth their light again. The "Stillalite" can be filled from the petrol tank or can, and can instantly be clipped on to any burner. A match lights up a surprisingly strong light that will last for two hours—ample time to get home, or to the nearest garage.

Strongly made, the "Stillalite" Emergency Lights will last a lifetime, and save their cost over and over again in "fines," "expenses"—not to mention the awkwardness of being without them when your lamp "gives out." Single Burner **3/9**

With Double Burner, giving double as bright a light **5/3**

Single Burner with Special Adapter for Side Oil Lamps **4/9**

BRICO
TRADE MARK
PISTON RINGS

These Piston Rings are manufactured on the most advanced principles known to-day. The experience of aircraft requirements during the war is embodied in both design and material.

We claim that BRICO Piston Rings are as near perfection as any piston ring in the world.

Even in appearance alone BRICO Piston Rings proclaim "quality," and a practical test of the rings in an engine will prove that their performance is equal to their appearance.

Perfect in finish, in fit, and in material, BRICO Piston Rings increase engine power and save lubricating oil.

BRICO Piston Rings are made for all popular motor car and motor cycle engines and are supplied from stock by return.

Traders should write for new Price List H. Private motorists are supplied by Garages and Dealers.

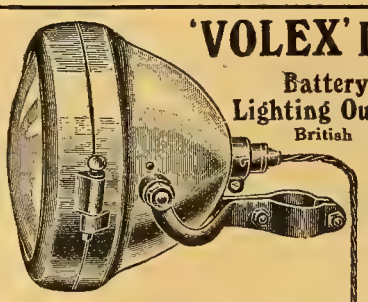
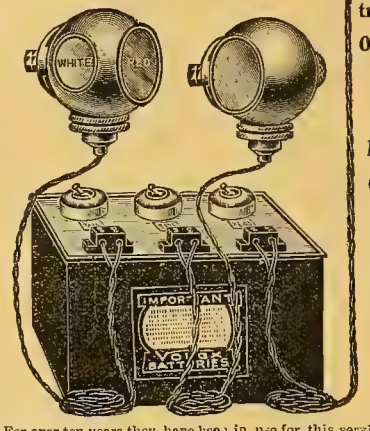
British Made.





The Ideal no trouble Outfits for the Motor Cycle and Sidecar.

For over ten years they have been in use for this service, and of recent years, in consequence of their dependency, the demand is constantly increasing. Dynamo Lighting Sets with Accumulators require careful attention, and, owing to complications, have a tendency to go out of order. Accumulators, if not regularly charged, whether in use or not, sulphate and become useless. The Batteries, which are fitted in a metal container with switchboard mounted on top, lie conveniently in the bottom of the sidecar, and with ordinary care will last, when in use, from 6 months to 18 months without renewal. If one of the batteries becomes exhausted it can be replaced independently of the others at but little cost. Comprising Superba Head Lamp (6in. front) Tail or Torpedo Pattern Side Lamp, Ball Tail Lamp "Volex" Aero Dry Batteries in special metal container with switchboard mounted on top, complete with waterproof conducting cords and spare set of bulbs. As illustrated. No. M.C/49.

£9 15 0

Also supplied with the "Superba de Luxe" Headlamp (6¼ in. front) as illustrated.

£10 15 0

INTEGRITY

LAYTON GARAGES

DEFINITE ADVANTAGES *for* CLIENTS

Although our ever-increasing circle of friends realise every day more clearly the definite advantages that attach to trading with us, there are circumstances that make it possible for us to give even greater advantages at certain periods.

¶ **At present, owing to the conclusion of the Summer Term at Oxford, very many machines are changing hands, and these can be offered while they last at prices that represent bargains in the most positive sense of the word.**

Our wider circle of friends can have details on application by postcard. **Machines may in every case be had on approval** To those who are new to us, we beg to point out that business by post is a special feature with us, and that their letters will in each case be treated as a call in person.

Here are a few examples taken at random from our June list—

INDIAN 1920 Powerplus Combination, complete with usual equipment. New March, 1920. Price **£205.**

ENFIELD 1920 Two-stroke, 2-speed Lightweight. **£67.**

TRIUMPH 4 h.p. 1919 (late) Countershaft with Grindlay Sidecar. Price **£130**

P. & M. 1919 (late) Combination, 3½ h.p. (P. & M. Sidecar), Head Lamp, Horn etc. Price **£125.**

A.B.C. SKOOTAMOTA, 1920. List price **£55,** plus carriage. Offered at **£51.**

ALLON 1920, 2-speed, cost **£87 10 0.** Price **£76.**

IVY 1920 Lightweight, Single speed model. Cost **£59. 48 Guineas.**

OUR JUNE LIST gives details of between 30 & 40 MACHINES.

Kindly send stamp for reply.

The "Speedy Sporting Single",

advocated by the Editor is a "going" proposition when fitted with a

'Pneu' Multi Pulley

This super-efficient pulley, the result of seven years' development, is the ideal thing for Triumphs, Nortons, Rovers, and all other fast single drivers with outside pulleys, also for Douglas, Cedos, Calthorpe, Diamond, Sparkbrook, Quadrant, New Hudson, James, etc., etc., with offside gear-box pulleys.

It gives a range of speeds on each gear, where usually the top gear is a little too high for a moderate hill, and the low gear too slow.

Gives free engine, and a range of speeds from 7½ to 1 up to 3½ to 1. On two-speed gear boxes from 3 to 1 to 20 to 1.

NO BELT SLIP.

NO END THRUST.

FITTED IN SIX MINUTES.

Price £5 10 0, postage 1/-

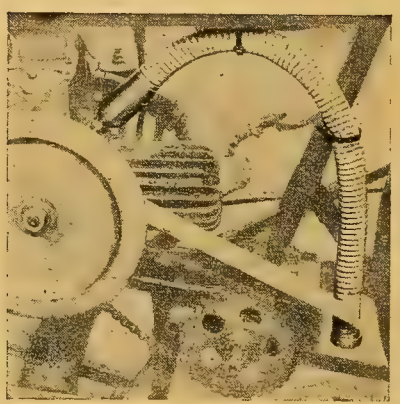
DET'S BREATHER

Have you a 2¾ DOUGLAS? If So, Read This!



We do not claim that the device illustrated is beautiful, or adds to the appearance of the machine. We DO claim, however, that you will derive the following advantages by fitting one, namely :—

1. Easier Starting.
2. Greater Flexibility.
3. Cooler Running.
4. An appreciable increase of Speed.
5. No more leaky Crank Case Joints.

It is a Breather, and its function is to relieve the air pressure in the Crank Case without allowing any Oil to escape, or Dust to enter. It contains no moving parts. Every part is a fixture, and there is nothing to go wrong. The Flexible Tube is for carrying away Fumes from the Crank Case, which are prevalent if the Piston Rings are worn.

It is fitted in a few moments by removing the small plug in the Crank Case, screwing in by hand, and securing the Tube to the frame by the Clips provided.

Order now to ensure delivery by return.

Finished in Nickel. Packing and Postage Free in the United Kingdom.

PRICE ONE GUINEA.

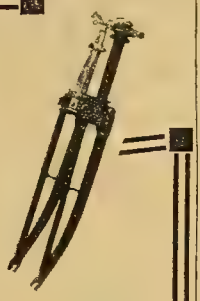
PATENT

SPRING FORK.

No. 8679/20.



The Invention provides an improved Shock Absorber, and has in view placing the wheel and fork under resilient control. To this end the fork is pivoted to the structure of the machine at the place where it is usually fixed thereto, and re-acts against a cantilever spring, the thicker end of which is rigidly connected with the fork and the thinner end ofwh ich re-acts against the rigid framework of the machine.

In a simple embodiment of my Invention I pivot the front fork to the lower end of the steering rod at the place where there is usually a rigid connection, and I mount my cantilever spring on a lug extending forwardly or outwardly from the upper end of the pivoted fork from the bridge piece constituting the groin of the legs of the fork, this lug extending about at right angles to the steering head, and, therefore, to the upper portion of the fork.

On and above this lug I mount the cantilever spring, by providing an upward extension from the lug, this extension being at right angles to the lug, and therefore parallel with the steering head. On to this extension I bolt the thicker end of the cantilever spring, which therefore lies parallel to the head, and causes the upper or thinner end of the spring to re-act, I pivot the thin end of the spring to a suitable collar on the upper portion of the steering rod by means of a pair of shackle plates. The cantilever spring is thus able to move longitudinally because its upper or thin end is pivoted to the plates.

In action, the effect of the Motor Cycle, running on a bad road, is to cause the fork to oscillate about its pivoted connection to the steering rod whenever the wheel rises or falls erratically.

The lug has a corresponding oscillation, and the spring is simultaneously thus given longitudinal reciprocation Since its thin end must have a movement substantially only parallel to the steering head, the spring is, therefore, bent when such oscillations occur, and always tends to restore the wheel to its normal position.

Any person interested in the above, with a view to their taking it up and putting it on the market, should apply to—

SIDNEY ROBINSON,

10, Bamford Road, Didsbury, MANCHESTER.

MOTOR CYCLES FOR SALE.

Zenith.

ZENITH, good condition, accessories; no reasonable offer refused; after 6.30.—103, Brigstock Rd., Thornton Heath. [1875

The English Six Days Trial.

MANY innovations are to be introduced into this year's A.C.U. Six Days Trial. The changes will undoubtedly be welcomed by the public, the trade, and the competitors themselves. In the first place, the decision to bring the competitors south from Darlington on the fifth day in order to finish at Brooklands will give motor cyclists of many counties a convenient opportunity of seeing the competing machines. After four days of hill-climbing in the north-eastern district, the riders will migrate to the south ready for Brooklands on the last day.

From the trade point of view, the inclusion of a speed test on Brooklands in place of the major part of the "final examination" should find favour with those entrants who recall the almost general dissatisfaction on this point in last year's event.

The schedule speeds for the various classes are not excessive, but the test will be of sufficient duration to serve a practical purpose, and will be one from which the human element is reduced to a minimum, whereas the defect of such tests as the consistent driving test of last year depended too much upon the personal factor.

The Question of Silence.

Apparently the silence tests—another unpopular feature of the 1919 trial—are not to be renewed. Although such tests are highly desirable, a better means than adopted last year could be devised. It was proved that noises recorded by the instrument used were affected by the position of the silencer pipe in relation to the recording instrument, whilst sounds, not offensive to the human ear, could not be distinguished from the ear-splitting note.

Cleanliness is another matter seriously requiring attention, but better means to bring this about can be devised than observation at the end of the Trial. If all riders were forbidden to clean their machines *en route*, a better comparison could be made; but even then it is hard to differentiate between mud thrown up by the wheels of the machine itself and that from passing vehicles.

While the rules and regulations are in the preliminary stage, it is to be hoped that the A.C.U. will not include anything in which anomalies can creep in to cause dissatisfaction, and on the question of cleanliness, probably the best means would be to demand mudguards of a certain minimum width.

Trade should have Regulations now.

There is every promise that this year's Six Days Trial will attract a very large entry, which will include many 1921 models. An early distribution of the rules and regulations may influence makers to give closer attention to such items as mudguarding.

Finally, in the matter of awarding marks, facts should be relied upon rather than personal opinion. Deductions of marks on the final examination should not be open to controversy. So long as it is purely a matter of a judge's opinion, protestation is almost bound to follow in many cases. Perhaps it would be possible to make every point entirely clear in the rules submitted to competitors before they enter. There is a feeling among would-be competitors that the regulations could be made much more clear and concise. We thoroughly endorse this view, and think that the A.C.U. is much too "technical" in its regulations, and, in endeavouring to make complicated rules clear, produces results which are often confusing and difficult for the average competitor to understand.

After last year's criticism on the final report, the judges may not again be tempted to draw deductions from the idealist point of view without giving full consideration to the questions of cost and general ulitity of future machines. We refer chiefly to their recommendation of water-cooling and similar complications which tend to increase costs

OCCASIONAL COMMENTS

BY 'IXION'

Rustproofing a New 'Bus.

LIKE one of our correspondents, Mr. Brooker, of Price's, is quite shocked at my levity in using hub lubricant for doping the platework of a new machine. This stuff is intended for internal use only, so to speak, and to smear it on the plating is akin to blasphemy. However, Mr. Brooker is not only critical, but helpful. He bids me dilute boiled linseed oil with three times its bulk of petrol, and brush it on lightly. The result is a smooth, hard coating, which penetrates everywhere, which cannot be removed, and to which neither dust nor flies will adhere. He uses it liberally under the bonnet of his small car. This is good hearing, except that I feel rather timid about the phrase "cannot be removed." Does Mr. Brooker mean accidentally, or nohow? Will he please put us under a further obligation by clearing this point up? I do not want to sickly the resplendent nickel of my new mount to a bilious yellow, which would not come off when I attempt to profiteer on the machine.

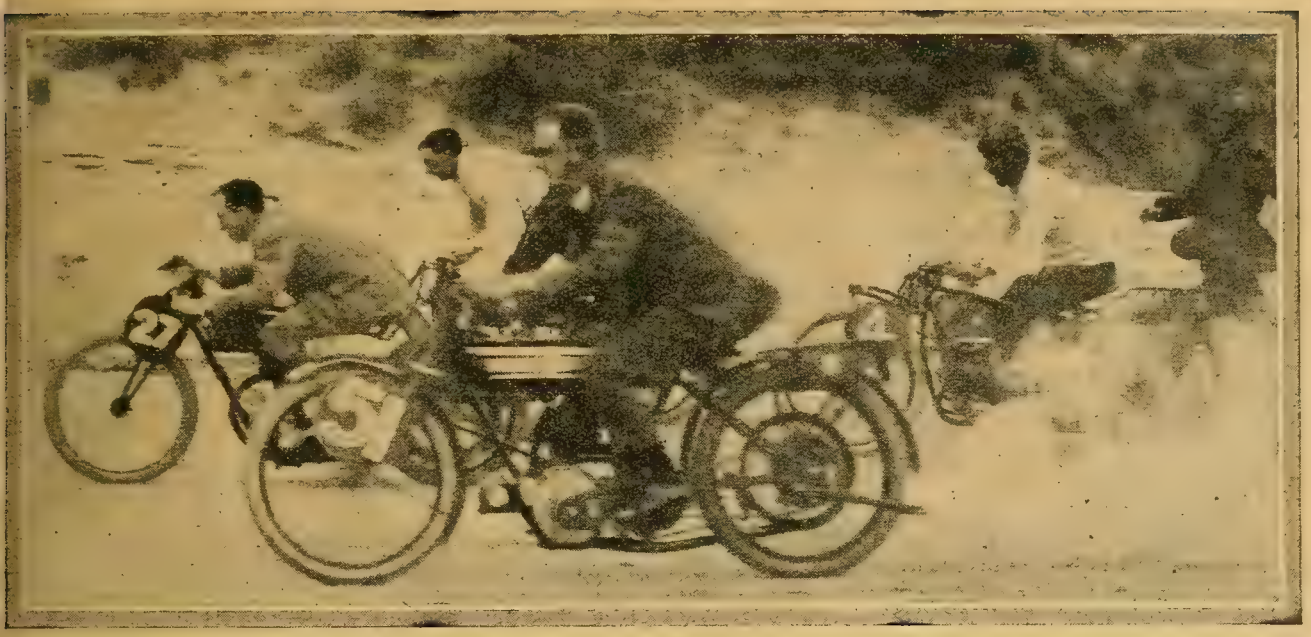
Low Speeds with a Rigid Drive.

AT low speeds, on a high gear with a rigid drive, two separate unpleasant sensations are possible if the transmission is not absolutely first-rate. One is merely audible, and may be described as a chatter or a clanking, the other is feelable, and consists of a series of tiny jerks. Neither need exist with an all-chain drive, properly equipped with well-designed absorbers. I can cite the 1915 A.B.C. and the 1920 Norton as simply ideal from this point of view, and, of course, there are others. The sole criticism which has been passed on the 1920 A.B.C. in my presence is that its shaft-cum-chain drive is not in all cases immune from either chatter or jerk when the engine is throttled down on third and fourth gears. Some riders assert that it is perfect in this respect, and others complain that the higher gears should be reserved for tolerable throttle openings. My own sample is assuredly imperfect on its high gears at small throttle openings, and this is the sole black mark I have yet scored against a very fascinating mount. I raise the point, because I am anxious to know whether this small defect is really universal, or whether my pinions have more backlash than they should, or whether liberal doses of a particular gear oil damp the trouble out of existence. I notice that one overseas technical journal roundly asserts that all good motor cyclists ease their clutches when running slowly on all-chain drives. I may be lazy, but I have never done such a thing in my life, and I am not going to commence so tiresome a practice at my age. The journal in question actually invites British makers to fit a variable hand-control of the clutch, so that it may be set to slip a little at low speed on top.

Front Band Brakes.

WHATEVER may be said in favour of external contracting band brakes on rear wheels, I strongly advise motor cyclists to give them a very wide berth on front wheels. No two of us regard our front brakes alike. A hard rider of my acquaintance invariably takes the shoes out of a front rim brake when he accepts delivery of a new mount. He says that they will soon drop out, anyhow. That if they should by some miracle stay in position, they have no real stopping power. That a decent rear brake will stop you anywhere. That, so far as the law is concerned, he has yet to meet the policeman who was not satisfied so long as the horseshoe remained on the machine. On the other hand, there are earnest men who speak of the front brake with bated breath. To enter for a Six Days without one would strike them as suicidal. Down a freak hill all the weight is on the front wheel, and a back brake has about as much arresting power as a trailing stand. For myself, I let the front brake stay where the designer put it, and I never use it. One of my machines has a front wheel band brake. Its metal band is so narrow and light that it has kinked itself, and taken a set: possibly some friend who borrowed the machine was fool enough to apply the brake: perhaps the metal is merely decrepit with age. Anyhow, the abominable thing is too decrepit to spring itself clear of its flanged drum, and a most distressful

Some of the finest natural speedways in the world are on tide-washed sands, and, as in America, the British coast town clubs are not slow to make use of them. The photograph depicts a scene at the recent Southport Speed Trials.



GETTING OFF THE MARK. The start of the 750 c.c. final at the recent Southport Speed Trials. The Norton in the foreground was one of the T.T. machines used in the Isle of Man last month.

squeaking and rubbing occurs at all times. I cannot obtain a spare from stock, and must choose between risking the penalty of the law or making a new band. Rear band brakes are made wide and thick, so that they may be trusted for a life of better duration.

A Dead Bogey.

FROM time to time in narratives of tours or forecasts of trials I encounter a phraseology which ought to be obsolete. The tourist describes how he paused to cool his engine before a particularly steep hill, or the journalist opines that on a certain knuckle a large proportion of the entry will be afflicted with overheating. Without pausing to discuss the exact purport of that ancient bugbear commonly called "overheating," I want to characterise such language as a hideous libel on the modern machine. Motor cycling must plead guilty to a lurid past, crammed with unsavoury incidents, but this bygone should now be allowed to be a bygone. For five or six years at least I have never been stopped on a hill with "overheating," if I except a few baby two-stroke engines with a penchant for frying their sparking plug points. Nor do I recall witnessing a stoppage of that kind on a competition hill for many a long day. I have seen plenty of competition riders baulked on hills through sheer bad driving, and in a very few cases they have failed to restart easily owing to clumsy clutch work or badly adjusted clutches. But it is surely true that any modern machine will climb any hill with ease and certainty on two conditions, viz., that the surface affords tyre grip, and that the driver is moderately adroit; and is it not also true that if the rider muffs his gears or steering, and makes a restart on a patch of decent surface after wheelslip has stalled him, the machine will get away well? This being so, we ought to drop nonsense about overheating on hills. To put the same thing in concrete form, Applecross-Tornapress is the most searching ascent in our islands: and even in pre-war days it did not trouble any standard solo machine which was not ridiculously overgeared. Trials secretaries have adopted the "freak hill" policy not because the average motor cyclist wants a machine which can climb catwalks, still less because the trade prefers a sporting course, but simply and solely because this country contains no gradients which can stall riders by dint of mere length or severity; and without hill stoppages the average trial would record an absurd percentage of gold medallists.

The Ideal Sports Mount.

THERE is hardly a gap left in the current range of motor cycles, which commence with the scooter and motorised push-bicycle, and ascend by easy stages up to the four-cylinder with car transmission, dragging a sidecar with a costly instrument board, camping outfit, and picnic equipment. Nevertheless I am still looking for the ideal sports model. I know all about the Brooklands Norton, the T.T. Triumph, and others of that ilk, but for a go-anywhere rider the single gear machine can be a shade *too* sporting at times. Some readers will remember a year in which the Scottish Trials went up Applecross, and a couple of trade teams were mounted on what might be described as I.O.M. belt-drivers; they had variable gears, and they were not excruciatingly heavy. But the unlucky wights who bestrode them had enough "sport" to last them a season, and said so. They roared up to blind hairpins at 30 m.p.h., and canted their 'buses over to make an angle of 30° or so with the ground-line, but even then they could not get round. Some of them took heavy crashes, some of them scraped round, and could not pick up again afterwards. I am still looking out for a lightweight, hotstuff, stripped machine, fitted with an emergency two-speed gear, on which I can get up Applecross without any pushing.

396 MILE RACE IN SOUTH AFRICA.

The Annual Johannesburg-Durban Races for Solo and Sidecar Machines. A Strenuous Affair over Execrable Surfaces and a Close Finish.

THE Johannesburg-Durban road race is regarded as the blue riband of South African motor cycle events. So important is it to those directly concerned that entrants spend in preparation amounts approximating to those of T.T. entrants. As an example, the expenditure of one Johannesburg firm was in the neighbourhood of £800, from which the importance of the event in Rand eyes may be appreciated.

The Solo Event.

It was raining when the men started from Johannesburg, and continued on and off all day. As a consequence the roads, which in the best conditions are far from good, developed into veritable quagmires, the surface so slimy, greasy and holding, particularly where the roads passed through the country of black loam, that it was marvellous how the riders managed to keep in the saddle. There were occasional short stretches a little better that served as a striking comparison. Soaked through to the skin as soon as they started, the men, nearly all of whom rode without mudguards, were instantly smothered with mud, and after the first thirty miles, the event resolved itself into an endurance run. Speed, as understood in this country, was out of the question, the machines careering from side to side of the road with the drivers at times out of the saddle and running alongside to enable the engines to pull through the grease. Even with the stripped machines the forks became clogged, acting as brakes which called for frequent stoppages.

Process of Elimination.

Of the forty-four starters, ten retired in the first 50 miles; at each succeeding mile falls were so frequent, with minor damage to the men and worse to the machines, that further numbers dropped out, and at Standerton, 96 miles, half the men had disappeared. So it went on from hour to hour until Volksrust, 150 miles, was reached, two miles from the border line between the Transvaal Province and Natal Province. Hereabouts is the fairly easy climb to the top of Laings Nek, a 40 m.p.h. climb in dry weather. Some idea of its condition can be realised when, very late in the evening, two only of the competitors pushed their machines up the last half mile, which occupied 30 mins. These two, Percy Flook (2¾ Douglas) and F. Owen (3½ Indian), thought themselves the only survivors. Flook was leading, but allowed the other man to overtake him at the top. Holding a council of war, they decided it was almost impossible to cover the 35 miles to Newcastle that night. So going down the 8 miles steep descent towards Ingogo, the historical farm house near Majuba Mountain was approached, and the owner at once made the men welcome. They decided to start together at daylight, but they did not know that when they had left Volksrust, still another plucky man, F. Zurcher, on a 494 c.c. spring frame Douglas, was doing his level best to keep going. He was exactly four hours behind them, without a lamp, and dead tired. A car driver found Flook and Owen at Majuba Farm with their wet clothes before a fire. He told them Zurcher had gone by. Flook was the first to get away, taking only 45 mins. to get into his wet clothes and to have the engine running. Zurcher reached Newcastle in 15 hrs. 49 mins, total riding time from Johannesburg, against the 4 hrs. 43 mins. the fastest time for 1919 over the same portion of the race route. Flook reached Newcastle 1 hr. 16 mins. later, and Owen 2 hr. 35 min. behind Zurcher.

Zurcher, with a bigger capacity engine than Flook, and the further advantage of a full sprung frame, now looked like winning easily, as the twenty-four hours' interval and strong sunshine had almost dried up the roads. Flook was handicapped still more by a cracked handlebar, caused by his many tumbles. Yet, despite the risk of the handle-bar snapping off at any moment, he went after Zurcher at a wonderful speed, and, just beyond Estcourt, 100 miles from Newcastle, had Zurcher in sight, when the handle-bar broke. This left Zurcher a clear run to the finish.

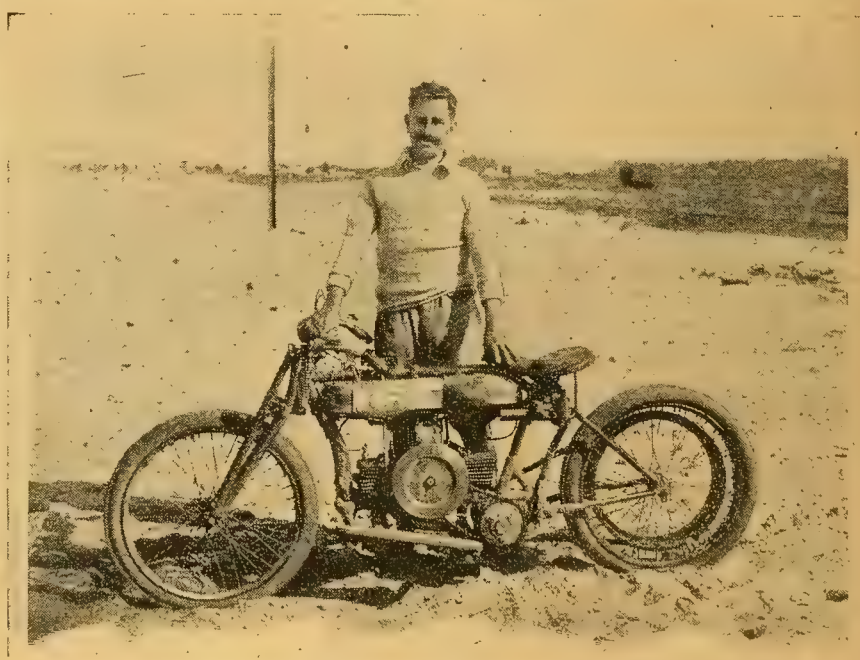
The Sidecar Race.

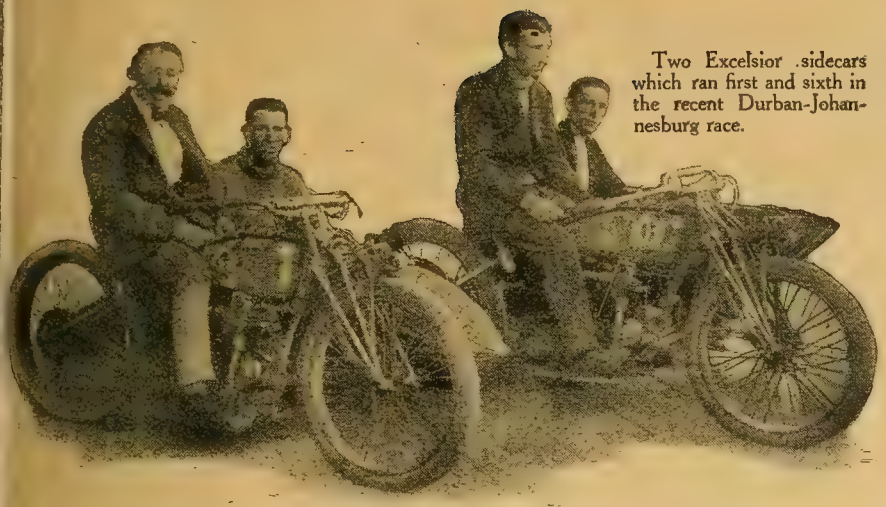
This event was decided concurrently, but in the reverse direction, viz., Durban to Johannesburg. There were fifteen entries and fourteen starters. The starters comprised four Harley-Davidson, three U.S. Excelsior, four Indian, one Enfield, one Rudge, and one Sunbeam. They were sent off at five minute intervals, the last man to leave being, therefore, 65 minutes to the rear.

An Exciting Race.

The roads for 150 miles from the coast as far as Ladysmith were dry, so that very fast times were accomplished for the fifty-four miles to Maritzburg, at which point there was hardly any change in positions. Fifty miles further on, T. H. Spargo (Harley-Davidson) was in front, when the outfit turned over. T. Van Diggelen (Harley-Davidson) broke his front forks at Estcourt. At thirty-five miles south of Newcastle, A. Long (U.S. Excelsior) had picked up the gaps between himself and those who had left earlier and finished first at Newcastle on actual time, with C. C. Smith (Harley-Davidson) 25m. behind. Long arrived with several spokes loose in the driving wheel, threads of nuts stripped at the front wheel hubs, and, immediately word was given to go on the second day, he spent 20m. repairing with the aid of half a dozen helpers. This left Smith with only 5m. to pick up over the distance of 184½ miles. In the next ninety miles, he pulled back 2m., and when they passed through Standerton, with 96½ miles to go, Long led by exactly 3 min. Yard by yard Smith reduced the difference, until, at a point some fifty miles from the finish, he was only 300 yards behind, and then came an unfortunate occurrence which undoubtedly lost him the race. Travelling at over 50 m.p.h., his passenger shouted to stop. The sidecar axle an American-



F. A. R. Zurcher (3½ Douglas), winner of the Durban-Johannesburg race for solo mounts, the blue riband event of South Africa.



Two Excelsior sidecars which ran first and sixth in the recent Durban-Johannesburg race.

The winning machine with the rider, A. Long, is shown on the left.

built type—was coming adrift, and, when they did pull up, it was discovered that it was only holding by two or three threads. Smith and his passenger were so confident of success that they did not hurry themselves.

Forty-six and a half miles from the finish, Long was leading, with Smith exactly 3m. behind. Again he overhauled Long until there was but 700 yards between them with 2¾ miles to the end. Hereabouts is a mile continuous climb, and at the summit Long held a lead of some 220 yards. From the top of this hill is an easy descent with corresponding ascent, and then less than a quarter of a mile over tarred surfacing to the winning line.

A Close Finish.

A dozen or more unthinking non-competitors on solo machines had chipped in behind Long at the top of the mile hill and so spread themselves across the road that, when nearing the finish, despite the yells of despair from Smith's passenger, they did not pull off the road. Without risking a terrible smash, it was impossible for Smith to get by, and thus Long flashed across the winning line less than 200 feet in advance. This wonderful finish, which unbiased spectators agreed that Smith might possibly have won on the post, was spoiled by the crowd and the motor cyclists mentioned. After such an extraordinary race, it was hard luck on Smith to have lost by so small a margin and under such circumstances. No doubt the officials will take measures to prevent a similar incident in a future event.

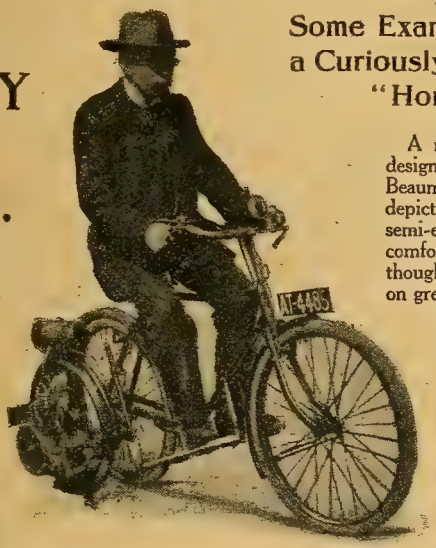
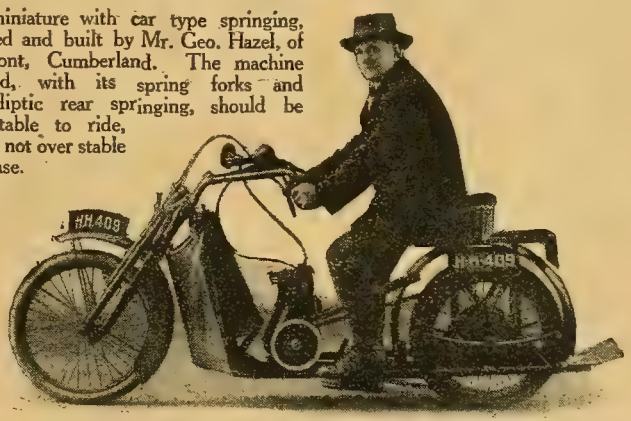
NOVELTY IN DESIGN.

Some Examples of the Utilisation of the Auto-wheel, a Curiously Constructed Passenger Machine, and a "Home-made" Rear Sprung Lightweight.

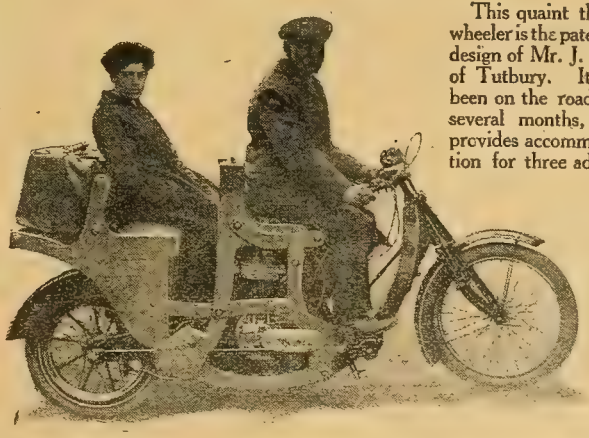
A useful little runabout machine has been made for Mr. R. Whitty, of Hull, by using a bicycle sans pedalling gear and an Auto-wheel.



A miniature with car type springing, designed and built by Mr. Geo. Hazel, of Beaumont, Cumberland. The machine depicted, with its spring forks and semi-elliptic rear springing, should be comfortable to ride, though not over stable on grease.

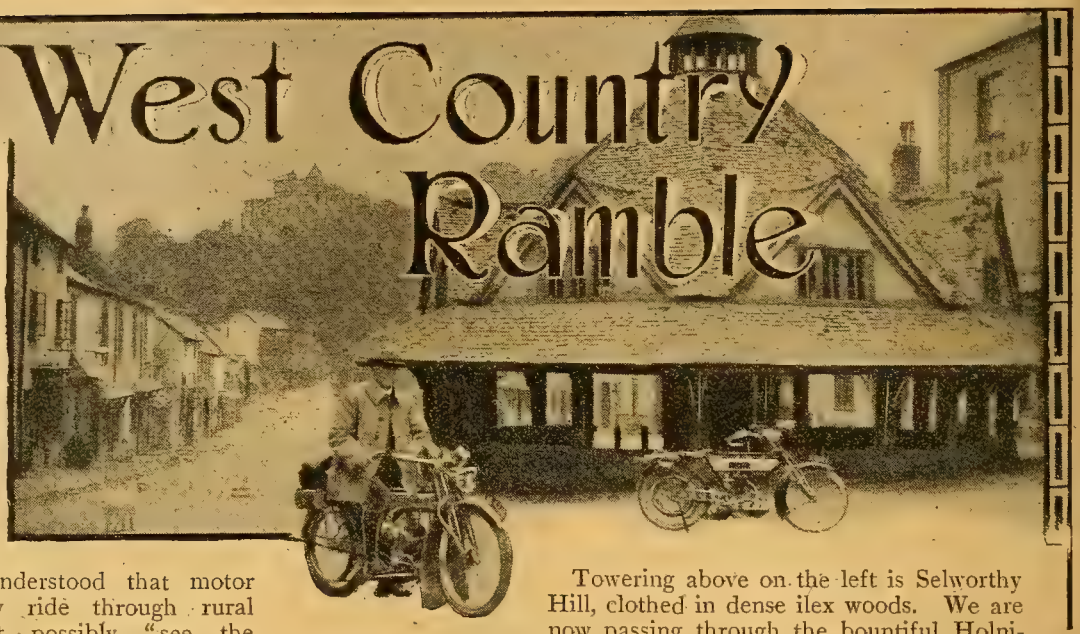


A miniature, which has been made by Mr. J. D. Timmins, of St. Albans, is another example of a light machine utilising an Auto-wheel



This quaint three-wheeler is the patented design of Mr. J. Cox, of Tutbury. It has been on the road for several months, and provides accommodation for three adults.

A West Country Ramble



Joys of the Road.

Gems of Scenery seen from a Motor Cycle

By A. VOWLES.

IT is generally understood that motor cyclists as they ride through rural England cannot possibly "see the country" or observe local details of an interesting nature. Provided they are interested in the locality through which they are riding and have "an eye" for the antiquated and picturesque, there is much—very much—to interest and instruct them as they speed through our beautiful English countryside. Whether it is possible for the motor cyclist to gain knowledge and interesting data while he journeys along the high roads depends very much on their condition, the state of the weather, the atmosphere and perhaps, most of all, on himself. Given fair conditions, there must be anywhere almost an endless programme of enjoyment, and it surely must be a relief to many tourists to have objects to look upon and think about more historical and truly different from speedometers, valves, belts, gear ratios, etc.

Since becoming a motor cyclist, the West of England has become much smaller, so to speak, as every point seems to be brought within easy reach. Interesting places can be visited so easily and cheaply, and so much information and knowledge gleaned by personal observation that life's arrangements and outlook have been truly altered.

Beautiful England.

A very beautiful ride, and one which the writer has enjoyed, is from Exmoor to the Mendip Hills, a distance of fifty miles. Both are situated in Somerset, one of our fairest counties, and the whole journey lies amidst beautiful and varied scenery. Most of the country through which this route lies was unknown to the writer previous to his ownership of a motor cycle, so that many of the interesting objects *en route* have been appreciated from the saddle of a solo machine.

Leaving Porlock village, nestling under the steep and dangerous hills of Exmoor, the highway strangely winds eastwards to Allerford, a peep of whose rustic footbridge and quaint cottages is obtained just before the road turns off from the village.

Towering above on the left is Selworthy Hill, clothed in dense ilex woods. We are now passing through the bountiful Holnicote Vale, and away to the south rise the open heathered hills of Exmoor, with Dunkery Beacon (1,707 feet) standing above the surrounding hills.

Venniford Steep soon looms up in front of us, and with a slight advance of the throttle lever the top is quickly gained. As we purr eastward, some delightful scenery is observed: woodlands, valleys, hills, and charming peeps of the Bristol Channel through the rifts of the hills. The fine seaside town of Minehead, under its North Hill, and fine church tower is reached in a few minutes; and, leaving it to the rear, we settle down on the high road to the Quantocks and Bridgwater.

Conegar Tower.

The first artificial object to arouse interest is Conegar Tower near the historic village of Dunster. It was erected on the conical hill in the eighteenth century by a lord of the Castle of Dunster as a landmark or finishing touch to the landscape. The motor cyclist will observe that it is a circular skeleton structure, and certainly lends itself to the beauty of the surrounding country. The turning to Dunster village is passed on the right, and, reaching the ground of the West Somerset Polo Club, we can plainly see the magnificent Castle of Dunster standing on a wooded hill in the middle of the vale. This beautiful mansion is one of the finest in the south of England, is of great historic interest, and possesses many objects and treasures of antiquity. Its important history is traceable for many hundreds of years. No motor cyclist should fail to add Dunster to his list of visits. It is without doubt one of the most beautiful spots in this country.

We must away! Carhampton, another quaint wayside village, with thatched cottages, is quickly reached, and on our left stands the church with fine tower surmounted by Decorated pinnacles. We still ride on historic ground, for at Washford, the next place of note, a glimpse on the right of some old ruins is obtained. These are the silent remains of a Cistercian abbey, which stand about three hundred yards from

A West Country Ramble.—

the road. The place was founded in the twelfth century, and flourished up to the time of the Dissolution. The ruins are fairly perfect, the gatehouse being the chief part visible as we pass along. Just here a quaint little railway runs under the road, it being the disused remains of a once busy track which runs to the iron ore mines in the Brendon Hills.

Picturesque Scenery.

The road here has an abominable surface, and is as crooked as it can be. East of Washford, the authorities have tarred the highway, and for one mile we can speed up through the fresh country air. We are now gaining the open heathered downs of the Quantock Hills, and some delightful views of them are obtained on approaching Williton.

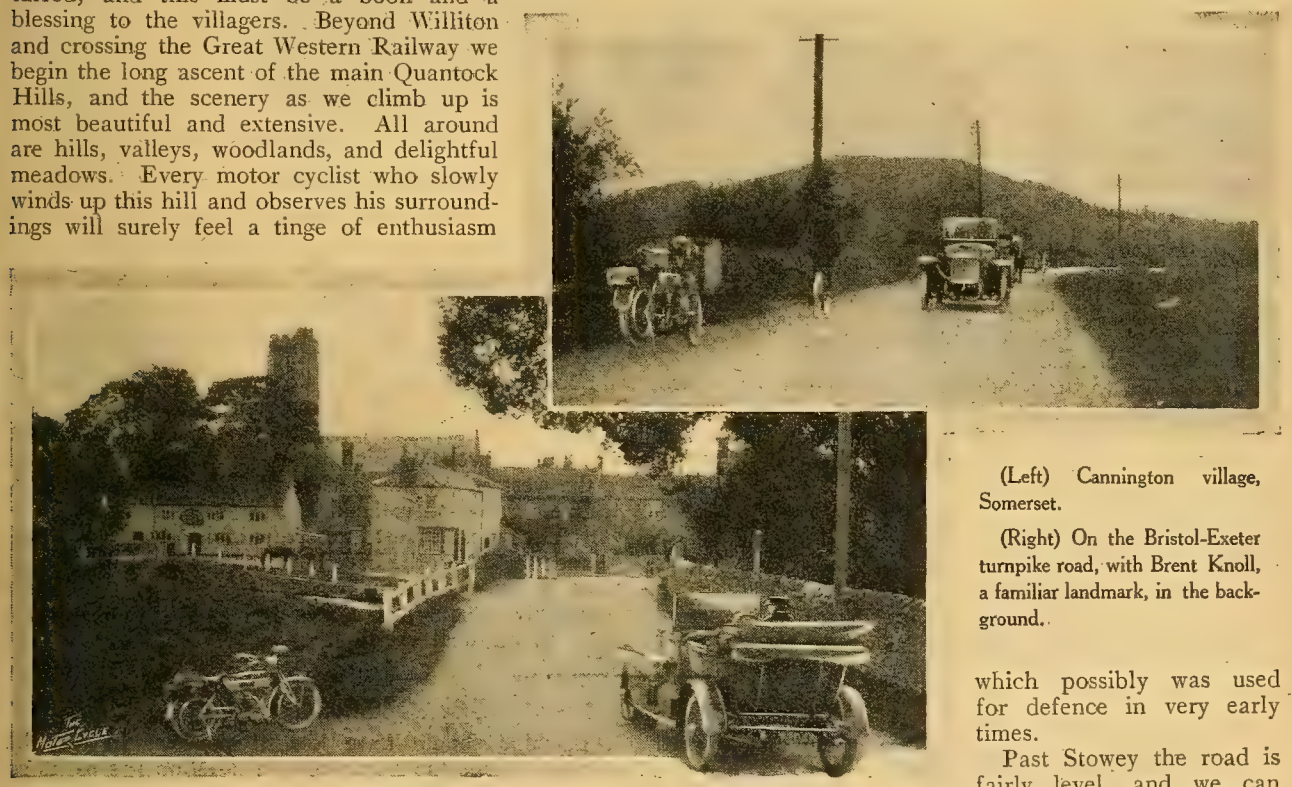
This is a picturesque Somerset village with many whitewashed cottages and thatched roofs. In its long street are two nasty turnings, but the roads are tarred, and this must be a boon and a blessing to the villagers. Beyond Williton and crossing the Great Western Railway we begin the long ascent of the main Quantock Hills, and the scenery as we climb up is most beautiful and extensive. All around are hills, valleys, woodlands, and delightful meadows. Every motor cyclist who slowly winds up this hill and observes his surroundings will surely feel a tinge of enthusiasm and admiration for this magnificent stretch of typically English country. At the top of the hill we pass S. Audries, a beautiful mansion surrounded by a deer park. A pretty church of Gothic design stands near the highway as the road bends to the left.

In a mile the eastern edge of the Quantocks is gained, and a great extent of country opens out to view. This is North Somerset bounded by the Bristol Channel.

The Welsh coast is plainly seen, with Penarth and Cardiff, the Islands of Flat and Steep Holm, Weston, Brean Down, Brent Knoll, Burnham, and, away in the far distance, the outline of the Mendip Hills; in fact, an enormous expanse of sea, hill, and level.

In a few minutes we are purring through little Kilve and away up the winding hill beyond, where we reach the highest parts of the Quantock Range. Across a valley on our right stands Alfoxden Park, where William Wordsworth and his sister lived at the end of the eighteenth century. He must have loved and been inspired by this glorious countryside, for history records that some of his best works were written during his sojourn here. This locality was also well known to Southey and Coleridge, for the latter lived at Nether Stowey, a typical Quantock village, through which we soon ride. Coleridge's cottage is about the first on the right, and the motor cyclist can see an inscription on the wall telling that "Samuel Taylor Coleridge made his home," etc. Opposite is an old wayside inn with a sign describing it as "The First and Last." Nether Stowey is a quaint old-world village, and long may it remain so.

It evidently has an ancient history, for one can see a camp-like formation on a hill near the village, which possibly was used for defence in very early times.



(Left) Cannington village, Somerset.

(Right) On the Bristol-Exeter turnpike road, with Brent Knoll, a familiar landmark, in the background.

Past Stowey the road is fairly level, and we can make the pace along these well-kept stretches. Cannington is soon reached. It is a picturesque place, with tarred roads. One of the beauty spots of the tour is seen on the east side of the village. The highway with various detached wayside cottages leads up to a bridge over a river, on the opposite side of which is an old inn with overhanging trees. Above the cottages rises the fine church tower, and, above that again, the open blue sky and shifting clouds. A charming spot!

An Old World Town.

In three miles we are in Bridgwater town: a place of considerable prosperity, it seems. It is impossible to note many details here, for the winding streets are

A West Country Ramble.—

generally congested with farmers and their flocks and herds, slow-moving vehicles, and children. Every motorist knows what this means! It is surprising so few accidents happen to the children of Bridgwater, for at many places it seems to be a playground for them. They are seen playing football, cricket, and building mud and dust castles, and the noise of a motor cycle and its violently blown horn seems to possess no terrors for them.

The Somerset Levels.

Beyond Bridgwater is probably one of the finest stretches of road in England. For a distance of from two to three miles it is perfectly straight, tarred smooth, and generally good: great temptations to go "all out." Enormous telegraph-poles rise high on both sides, so that one passes along an avenue of official poles. The country now is perfectly flat, and is part of the famous and bountiful Somerset Levels.

In the sporting centre of Minehead, a great hunting district. Consideration on the part of motor cyclists when meeting horses and hounds adds to the maintenance of goodwill between road users—a most desirable point.

Not far away on the right is Athelney, where King Alfred hid from the Danes; and to the south again lies Sedgmoor, where the last battle in England was fought. Glastonbury, too, with its historic and legendary lore, is not far off, for its famous Tor can be seen from some points rising out of the levels of green.

We can make rapid progress along these splendid stretches of level road. Dunball and little Pawlett, with its quaint church and stunted steeple, are soon in the rear. Huntspill is passed and Highbridge gained. The road through the main street is in a most abominable state, and a real disgrace to any road authority. Why it is allowed to continue so long like it must be beyond the understanding of motor cyclists.

Purring away from the jolts and bumps, we still are passing high telegraph-poles on each side, and the straight stretches of highway allow us to diminish the miles with astonishing celerity.

Brent Knoll, a big hill rising alone out of the level country, is soon "passing by us," and its peculiar formation proclaims it an ancient camp, probably Roman. On and on we tear along the smooth, broad highway, past East Brent, Rooksbridge, Tarnock, Badgworth, and Weare. The Mendip Hills are now near, and their smooth, rolling lines confront us. On our right we can plainly see the escarpment of Cheddar, one of the grandest gorges in the world, with its caves most wonderful. At Cross we leave the main road, and, turning to the left, Compton Bishop, our destination, is reached in a minute or so. It is a delightful Mendip village lying in a valley. Above the cottages rises the old church tower, and, above again, Crook Peak, a famous landmark, raises its head 600ft. above the level. As we gain the crest of the hill at "Dunyeat," a magnificent panorama opens out before us, and comprises most of the interesting country through which we have just passed. Against the western sky are seen the heights of the Quantocks, Exmoor, and Minehead Hill.

Thus ends a most interesting and instructive journey, and, thanks to the excellence and general convenience of a modern motor cycle, it has been undertaken quickly, cleanly, economically, and without worry or much physical exertion.

THE AGENT AND THE CUSTOMER.

FROM time to time I address a well-meant word to the motor cycle agents. I did so to one such agent in private last week. He has been supplying a motor cycle to the son of a farmer, who has presumably saved up his army gratuity, and after years of crowded comradeship in the service does not fancy being pegged down to a lonely farmstead in the country. I should suggest that a salesman of imagination would come to sundry conclusions about such a deal. In the first place, he would surely consider that in the spring a young man's fancy lightly turns to thoughts of love, and that therefore the selected machine should be powerful enough to pull a sidecar, or at least to transport a well-nourished damsel on the carrier. In the second place, since the local roads are distinctly hilly, and one can never say in advance what tuning skill a complete novice may develop, the selected machine should have lots of power. In the third place, since the homestead in question has as its sole exits *(a)* a very steep hill, and *(b)* a lane which is literally under water for part of every winter, whilst as *(a)* and *(b)* open into *(c)*, a steep trench filled with deep mud, a clutch seems essential.

Actually, the agent concerned has sold his customer a 2 h.p. two-stroke, of the clutchless, push-to-start two-speeded variety. It seems unquestionable that the customer will shortly desire a different type of machine for any or all of the reasons outlined above. Possibly the agent is counting on making a second profit; but there are other agents in the neighbourhood, and it does not follow that the original firm will have the triple job of (1) buying back the two-stroke, (2) reselling the two-stroke, and (3) selling a three-speeded sidecar.

IXION.

Innovations in the 1920 Six Days Trials.

Speed Test at Brooklands. Fast Hill-climb. Brake Test. Competitors to pass through the Midlands on the Fifth Day.

IT is by no means a new suggestion that the Six Days Trials should finish at Brooklands. It is one which has been put forward by *The Motor Cycle* on many occasions, but it is only this year that the Auto-Cycle Union has finally decided to include a track test in the Six Days. It is an interesting fact to record that as long ago as 1903 the first Auto-Cycle Club Thousand Miles Trial finished at the Crystal Palace track and included a speed trial; while the 1914 event included a short speed test alongside Doncaster racecourse.

A speed trial such as suggested for this year's event has a distinct advantage. It not only shows the public the actual speeds (within limits) of which the machines are capable, but it greatly simplifies the final examination. Defects which were not previously apparent may quite well show themselves when reasonably high speeds are indulged in for half an hour.

This speed trial forms part of the final examination for which twenty marks are allowed. Of these fifteen may be lost in the speed trial itself, one mark being deducted for each mile per hour, or part of a mile per hour, covered at less than the set speed, while a further five marks may be lost during the final examination if any obvious defects show themselves.

The Brooklands Test Speeds.

No excessive speeds will be asked, but a reasonable pace of which each class is capable will be demanded. The schedule speeds are as follow:

	Solo.	Sidecar.
Up to 250 c.c.	22 m.p.h. ...	—
Up to 350 c.c.	30 m.p.h. ...	20 m.p.h.
Up to 500 c.c.	35 m.p.h. ...	25 m.p.h.
Up to 750 c.c.	38 m.p.h. ...	30 m.p.h.
Up to 1,000 c.c.	40 m.p.h. ...	35 m.p.h.

It will be seen, therefore, that the speeds required for the half-hour will be quite reasonable.

Brake Test.

There will be a brake test on Brooklands Test Hill. One section of the hill will be marked out, which is to be covered at a speed of 10 m.p.h., and at the end of it each competing machine will have to stop on a defined line.

It needs no comment on our part to point out how important the holding power of the brake is on a motor cycle, and it is sincerely to be hoped that this test will lead to the fitting of even more efficient brakes than in the past.

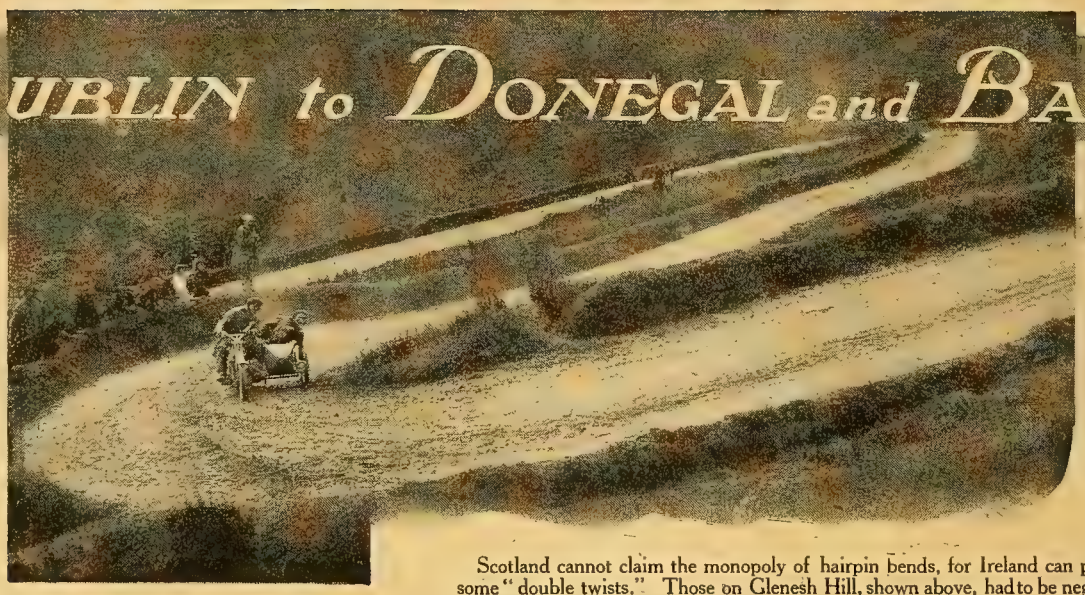
Fast Hill-climb.

Yet another innovation will be a timed hill-climb on a hill known as Holme Moss, between Holmfirth and Woodhead Reservoir. The hill is three miles long, and has a gradient according to the Contour Road Book of 1 in 10, with a rather steeper section. The results will be decided on the old A.C.U. formula, $\frac{C \times T}{W}$, in which C is the cubical capacity, T the time, and W the weight of motor cycle and rider.

There is little doubt that the timed hill-climb will be extremely popular, and will be of considerable spectacular interest. It will be taken during the fifth day's run, when the competitors will travel from Darlington to the neighbourhood of Warwick and Coventry, in which district the competitors will be billeted in various localities. This will conclude the fifth day of the trial, while the finish will be at Brooklands track, which will be reached in good time on the last day.

The run from Darlington to the south of London will be off the beaten track, totally avoiding the Great North Road. This will include several hills, one of which we have mentioned.

DUBLIN to DONEGAL and BACK



Scotland cannot claim the monopoly of hairpin bends, for Ireland can produce some "double twists." Those on Glenesh Hill, shown above, had to be negotiated by competitors in the recent Dublin and District M.C.C. Trial.

Dublin and District M.C.C. Twenty-four Hours Open Trial

THE twenty-four hours open trial of the Dublin and District M.C.C. this year did not attract any English entrants, but a representative native entry was received for the event, Cork sending up a good contingent. The route was the usual one to Donegal and back, but owing to the disturbed state of affairs in Londonderry it was deemed advisable to cut out that city, and consequently a deviation of the route was made at the eleventh hour. After leaving Dungiven the competitors followed an intricate route to Strabane, joining the original course at Letterkenny. Thirty-five competitors started from Dublin on the Friday evening, and most of them reached Belfast on time, despite heavy rain in the later stages of the journey. A lengthy stay was made in Belfast to reduce the amount of night riding, and dawn had broken by the time the Sperrin mountains in Co. Tyrone were crossed.

In Troubled Country.

Between Dungiven and Strabane the leaders found the road blocked by a tree, but the obstruction was easily removed. Shortly afterwards a smouldering police barracks explained the reason of the obstruction.

The ascent of Glenesh mountain in Co. Donegal proved the crucial part of the trial. The hill is regarded as the steepest to be found on any main road in Ireland, and its lengthy gradient and surface combine to make it a very severe test. By the time it was reached the field was reduced to thirty-two, and of these twenty-two made clean ascents. None of the two-strokes got up without help, but all of the nine singles made good climbs. The medium-powered sidecars made a very good show, only two failing out of eleven, but in the big sidecar five out of nine failed.

Accident Delays Competitors.

The proportion of finishers in the trial would have been very high were it not that in the concluding stages of the journey a bad accident occurred, and several of the competitors retired to render assistance. In trying to pass another competitor on a sidecar, W. R. Clarke, whose wife accompanied him as a passenger, miscalculated his speed at a curve. He struck the grass edge of the road with his front wheel, and the combination overturned, both driver and passenger being thrown on the road. Both were unconscious for a considerable period. The accident took place about sixty miles from the finish.

Twenty-three riders checked in at the final control at the Phœnix Park on Saturday evening. An examination was made of the machines, and marks deducted for breakages. The penalties under this heading will be very heavy, as broken frames and sidecar chassis were numerous, testifying to the severity of the 400 miles covered. The finishers were as under :

J. Browne (2¾ Douglas).
E. B. Russell (5 Brough).
T. Woods (6 Martinsyde-Newman sc.).
J. Healy (5-6 James sc.).
A. Carton (3½ Sunbeam).
R. H. Dodd (4 Norton sc.).
P. H. Hurse (4 B.S.A.).
M. J. Doyle (7-9 Excelsior sc.).
Major J. A. H. Waters (4 Norton sc.).
R. Humphries (2¼ Velocette).
D. Allen (4 Norton).
E. H. Bell (5-6 James sc.).
J. Carville (4 Triumph).
F. Wallen (2¼ Triumph).
H. McAllister (6 A.J.S. sc.).
S. G. Smith (4 Norton sc.).
P. A. Bell (5-6 James sc.).
W. J. Burney (8 Enfield sc.).
C. S. Kettle (4 B.S.A.).
A. Wilhelmj (8 Matchless sc.).
C. W. Johnstone (7-9 Harley-Davidson sc.).
T. E. Green (4 Blackburne).
T. Holland (2¾ Triumph).

The official results of the trial will be announced later.

FINDING A WINNER IN A HILL-CLIMB.

TO find a satisfactory basis for handicapping, the Newcastle and District M.C. is running its hill-climb on July 17th on somewhat original lines.

The competitors in the respective classes will start in pairs, and in the second round the winners of the first heat will ride with the winner of the second heat, and so on until only one rider remains. All riders will be timed, and in the final two riders from each class (the winner and rider making the next fastest time) will compete in a handicap based on the fastest times in each class. For example, should the fastest time in Class 1 be 60s. and in Class 7 50s., then the Class 1 riders will get 10s. start from the Class 7 riders.

It will be interesting to know how this scheme works in practice.

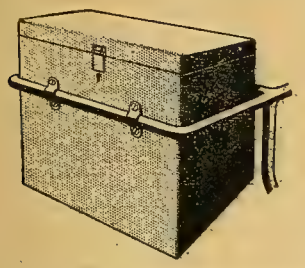
SPORT IN ITALY.

WE understand that the Italian sporting club, known as the "Audace" Club Sportivo, has formed a motor cycle section consisting of about seventy members, including some of the best known Roman motor cyclists. The section is well organised and is busily engaged in arranging races and reliability trials. The programme includes a reliability trial on July 18th, racing on the Fiuggi track on August 15th, and on October 3rd a large race meeting on the racecourse in Rome : the course is five miles in length, and will be covered thirty times. This, we are informed, will be one of the most important races in Italy during the year. Numerous valuable prizes are being offered, and the best-known Italian motor cyclists are to take part. The course will be tarred and many stands will be erected. The club in question extends a hearty welcome to British competitors.

IDEAS: Useful and Ingenious.

Motor Cycle Tool Box.

MANY motor cyclists prefer a strong metal tool box to the leather pannier bags usually fitted, but often the position of the filler caps and oil pump prevent the fitting of a box on the tank. A very neat tool box of ample size can

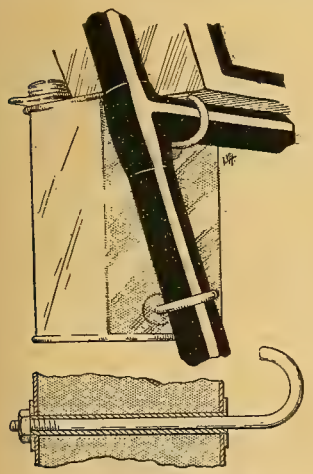


A substitute for the leather tool bag.

be made to fit inside the rear of the carrier; the one shown was made in order to fill this usually unoccupied space, and fitted to a 6 h.p. A.J.S. it has proved very satisfactory.—N.M.B.

A Home-made Tank.

A QUICKLY detachable auxiliary petrol or oil tank can be quite easily and cheaply made from an ordinary quart oil tin. The tin is suitably drilled to take copper tubes, which are cut so that their ends protrude sufficiently to

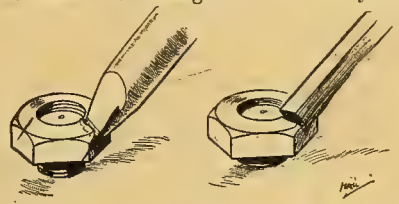


A useful spare petrol tank.

take large flat washers. They are then soldered in place as shown in the sectional illustration. A hooked bolt, made of about $\frac{1}{4}$in. steel rod, is passed through each tube and secured by a nut, the hooked end engaging the frame tubes at suitable points.—L.H.

Useful Method of Tightening Nuts.

WHEN screwing up a nut in a confined or awkward position, a cold chisel and hammer have sometimes to be used in place of a spanner. If the cold chisel is employed, however, for this job, a risk is run of cutting the nut away on one side, or of mauling it so badly that it becomes almost unserviceable. A good tip is to cut a notch in one side of the nut in the direction of rotation, and to punch the nut up home with a small piece of steel having a square head in place of the cold chisel. It will be found that this improvised tool does not tend to damage the nut beyond

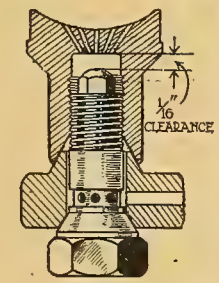


A method of tightening inaccessible nuts.

repair. This hint applies particularly to internal flywheels, where a nut loose or not firmly driven home may lead to disaster.—A.M.

A Tip for Amac Users.

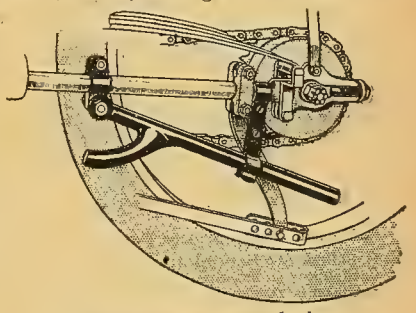
THE main jet of an Amac carburetter usually screws up into a chamber which has five or more smaller holes arranged in line immediately above the jet. It is very important that there should be a clearance of $\frac{1}{16}$in. between the top of the jet and the top of the inner chamber, as any variation in this clearance will affect petrol consumption and running efficiency considerably. When fitting a new jet, care should be taken that it does not screw up tightly against the top of the inner chamber, as, apart from the bad results obtained by having no clearance, it will also prevent the proper tightening of the float chamber projection. A pencil passed up to the top of the inner chamber and marked off at the jet plug shoulder will enable one to test if the jet to be fitted will permit of the necessary clearance.—A.V.H.



Jet clearance in Amac carburetters.

A Rear Stand for Morgans.

OWNERS of Morgan Runabouts who have experienced rear tyre trouble, and who have been at a loss as to how to jack up the rear wheel, will no doubt appreciate the following description of an inexpensive method of fitting two simple stands. An old motor cycle stand of the type illustrated was purchased at scrap price from a garage, and the cross-piece removed, leaving the two legs. Two

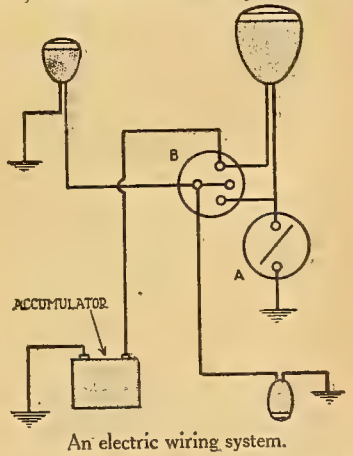


A simple stand for three-wheelers.

clips were made to fit the main tubes forming the rear frame, and to these clips the separate legs were attached as shown in the sketch, the holes in the top of the legs being bushed to take a $\frac{5}{16}$in. bolt. Two extra clips of spring steel were fitted in order to hold up the legs when not required. When in use the front wheels should be adequately scotched both fore and aft to prevent swinging.—T.T.L.

Economical Wiring.

THE simple method of wiring illustrated herewith is claimed to be most economical in current consumption. A represents a single-way switch, while B is a two-way and "off"



An electric wiring system.

switch. Now that electric lighting of sidecar outfits is becoming increasingly popular, this suggestion should prove of considerable use to readers.—J.L.B.

THE CLUB CHAMPIONSHIP.

The Leicester and District M.C.C. wins "The Motor Cycle" Cup in the M.C.C. Team Trial.

In consequence of one of its members exceeding the speed limit allowed in each circuit of the M.C C. Team Trial, the South Birmingham M.C.C. team, originally given as winners of "The Motor Cycle" Trophy; have lost their premier position.

FURTHER investigation of the provisional results has resulted in it being found that H. H. Saddington (James) covered a lap in excess of the speed allowed. This has accounted for a considerable alteration in the results, and, as will be seen by the figures published, the Leicester and District M.C.C. secures first place. The organising club showed a total error only 4 min. 40 sec., and had not Sharratt been riding with his hands in his pockets, when he struck a patch of wet tar and skidded, a different tale would have been told.

The official results are as follow:

FIRST (Cup Winners).—Leicester and District M.C.C.

	Lap variations.		Total.
	m. s.	m. s.	m. s.
A. Wooding (4 Sunbeam)	1 34	30	2 4
J. Willcox (3½ Rudge)	1 55	55	2 50
W. C. Pym (4 Douglas)	40	33	1 13
Will Chapman (6 A.J.S. sc.)	41	1 9	1 50
R. Harris (4 Triumph sc.)	1 9	2 8	3 17
H. Pole (8 Morgan)	1 46	2 10	3 56
Total consistency figure for team			15 10

SECOND.—Surbiton and District M.C.C.

R. G. Spikins (7-9 Harley-D.)	58	57	1 55
R. C. Staunton (4 Triumph)	25	1 5	1 30
L. T. Gilson (8 Zenith)	52	1 33	2 25
R. C. Charlesworth (8 Zenith)	1 32	2 2	3 34
H. Jepson (8 Zenith sc.)	2 2	2 40	4 42
Rex Mundy (6 Martinsyde-Newman)	2 30	3 11	5 41
Total for team			19 47

THIRD.—Worcester and District M.C.C.

E. Williams (3½ Sunbeam sc.)	4 1	1 44	5 45
J. Westwood-Ellis (2¾ Verus-Blackburne)	1 1	2 15	3 16
T. C. de la Hay (3½ Sunbeam)	1 25	34	1 59
J. A. Chadwick (2¼ Diamond)	3 24	3 37	7 1
E. W. Choldcroft (6 A.J.S.)	13	1	14
J. Dudley (3½ Sunbeam sc.)	2 15	2 2	4 17
Total for team			22 32

The positions of the other teams, by mileage, are as follow:

Ealing and District M.C.C., 581½
Kidderminster M.C.C., 552½
South Birmingham M.C.C., 552¾ (one man too fast)
High Wycombe and District M.C.C., 552½ (one man too slow)
Bedford and District M.C. and L.C.C., 543
Luton and S. Beds. A.C., 538
Rochester, Chatham and District M.C., 525
Motor Cycling Club, 523½
Sheffield and Hallamshire M.C.C., 501½
Gipsy M.C.C., 498½
Coventry and Warwickshire M.C., 493½
Ilkley M.C. and L.C.C., 460½
Middlesex M.C.C., 455
Essex M.C., 438
Sutton Coldfield and North Birmingham A.C., 421
North London M.C.C., 420½
Blaenavon M.C.C., 416
Liverpool M.C., 412
Camberley and District M.C.C., 407½
Norfolk M.C. and L.C.C., 393½
Birmingham M.C.C., 387½
Waspes M.C.C. (Cambridge), 364½
Oxford M.C., 304½
Wolverhampton M.C.C., 247½
Woolwich, Plumstead and District M..C, no claim

Best Individual Scores.

Kidderminster M.C.C.—R. Fellows (4 Triumph)	1 + 0 = 1
Gipsy M.C.C.—A. F. Selby (3½ Sunbeam)	1 + 3 = 4
Motor Cycling Club.—E. A. Colliver (7 Indian sc.)	4 + 4 = 8
Motor Cycling Club.—J. A. Newman (3½ Sunbeam)	1 + 10 = 11
Sutton Coldfield and North Birmingham A.C.—J. Watson-Bourne (3½ Ariel)	13 + 0 = 13
Worcester and District M.C.C.—E. W. Choldcroft (6 A.J.S.)	13 + 1 = 14
Luton and S. Beds. A.C.—G. S. Davidson (2¾ Diamond)	8 + 6 = 14
Essex M.C.—F. A. Applebee (4 Indian Scout)	3 + 14 = 17
Essex M.C.—F. Thorpe (2¾ Douglas)	4 + 18 = 22
Essex M.C.—F. Roberts (3 A.B.C.)	16 + 12 = 28

Each machine's first lap was taken as his standard, the errors are shown as the difference from that standard in the second and third laps. These two errors were added together.

ANGLO-DUTCH TRIAL.

Comprehensive Programme arranged to entertain British Competitors in this International Trial.

AN interesting programme is being arranged for the entertainment of the British motor cyclists competing in the Anglo-Dutch trial in Holland, August 5th to 9th.

Briefly, the programme is as follows:

THURSDAY, AUGUST 5TH.

The British and Dutch competitors arrive at Maastricht (South Holland), where they will be received by the Council of that town. There will be a dinner at the Hotel "Savante" in the evening.

FRIDAY, AUGUST 6TH.

A social run will be made through the south of Limburg, with dinner at Valkeburg, where a visit will be made to the rockery and gardens for which the place is famous.

SATURDAY, AUGUST 7TH

The Anglo-Dutch trial. The start is from the garage Grabal, Maastricht, and the route will include Heerlen, Sittard, Roermond, Venlo, Nymegan, Arnhem, Ede, Woudenberg, Zeist, Utrecht, Nieuwersluis, Ouderkkerk, Kalfjestaan, Amsterdam.

SUNDAY, AUGUST 8TH.

A social run through "t Gooi," lunch at Hilversum, a visit to the Stadion. Official dinner in Amsterdam.

MONDAY, AUGUST 9TH.

The British competitors will leave Holland.

In the meantime, the Dutch organisers are busy selecting the team to represent Holland in this popular international contest, and if the lists already put up for selection are any criterion, the machines will be chiefly American, showing how the U.S.A. has spread its trade arms over the country.

Of twenty-four private riders put forward sixteen ride American Excelsiors, Harley-Davidsons, Indian and Henderson machines; four have British mounts (Douglas, Cedos, James, and Royal Enfield); two German (Wanderer and N.S.U.); one Belgian (Sarolea); and one Dutch (Simplex).

Among the trade riders suggested, British machines are better represented, while several French mounts are included, and a good sprinkling of American types

British machines mentioned include Douglas, Cedos, N.U.T., Metro-Tyler, Blackburne, A.B.C., Martinsyde-Newman, Clyno, and James.

R. O. CLARK IN THE JUNIOR T.T.

WHEN R. O. Clark finished his plucky ride in the Junior T.T., on a flat tyre and a wobbling front wheel, it was generally assumed that he had punctured, while in many quarters it was stated that he had sustained a tyre burst, which had been responsible for his fall

As Clark collapsed at the finish and was taken to hospital, what had happened exactly was not known until the rider returned to Norwich We have now had a long letter from him, in which he states that he has had a lot of trouble with his back as a result of his fall, but is now making recovery.

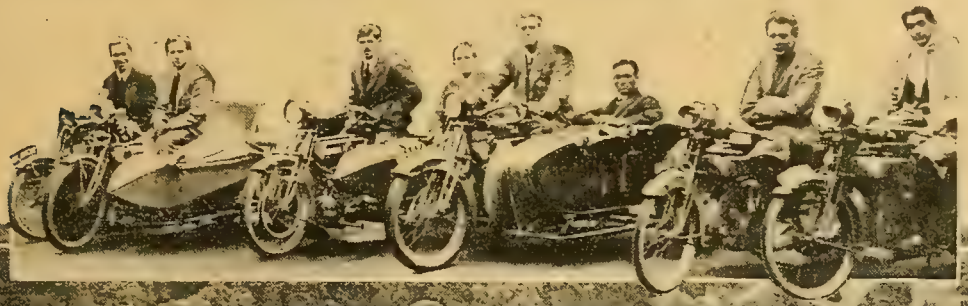
He tells us that he has little to relate regarding the race; in his own words "it was head down and throttle wide nearly the whole time." On the first lap, he cannot remember having seen a single machine, and his only mechanical trouble was that the driving chain came off twice through the connecting link giving way.

On picking himself up after his spill, he tells us that the outlook seemed black indeed. On examining the machine, he found that the front wheel was so badly buckled that it could not be forced round its axle. His weight, which had been a handicap to his little machine on the up grades, now stood him in good stead, for he managed to straighten the wheel sufficiently to allow it to pass the forks, by jumping on it. The tyre, however—a Hutchinson, by the way—had to be deflated, and in this condition he finished.

The machine is now on view at Godfreys, Ltd., 208, Great Portland Street, W.1.

The Club Championship for 1920.

LEICESTER AND DISTRICT M.C.C. THE WINNERS AFTER ALL!



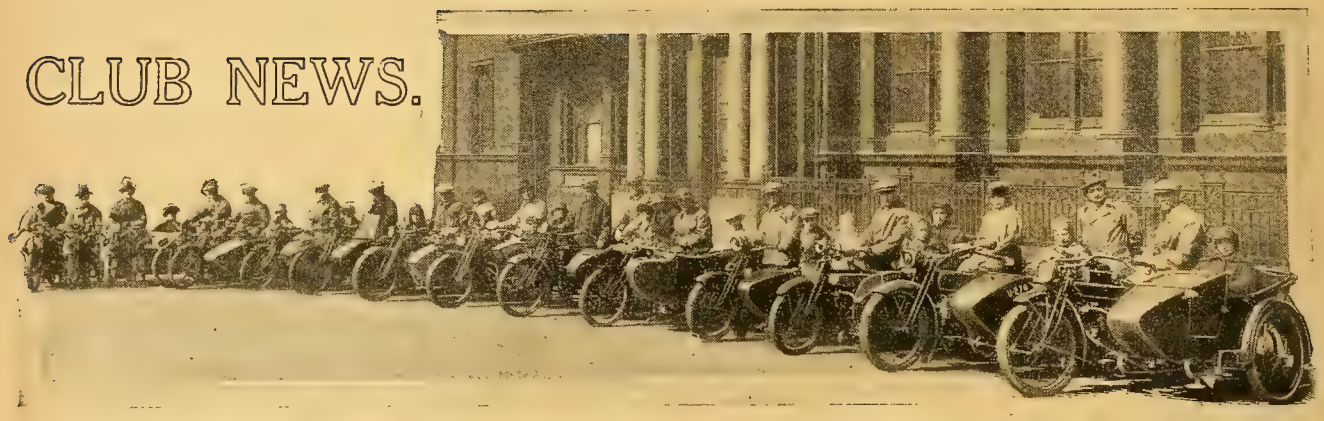
AN AIRMAN'S VIEW OF TRING.

Tring, the centre of the M.C.C. Team Trial for "The Motor Cycle" Cup. Competitors in this club championship event were much interested in the evolutions of the aeroplane, from which the accompanying general view of Tring was secured on the 26th ult. Mr Joseph Edge, an old and valued contributor to "The Moto Cycle," was the photographer.

Provisional winners and actual winners of *The Motor Cycle* Challenge Cup in the M.C.C. Team Trial are shown on this page. The upper photograph shows the South Birmingham M.C.C. team, who, until the second checking of observers' sheets, were regarded as the winners. Subsequent examination by the M.C.C. timekeepers revealed that one of the riders had exceeded the speed limit allowed. Reading from the left, the riders are: G. Denley (Velocette), J. H. Walker (Triumph sc.), H. Uzzle (B.S.A. sc.), H. H. Saddington (James sc.), B. Bird (2¾ Verus), B. Kershaw (2¾ Verus).

THE VICTORS. In the lower group is shown the victorious Leicester team, which has been adjudged the winner. The riders are: J. Willcox (Rudge), A. Wooding (Sunbeam), H. Pole (Morgan), R. Harris (Norton sc.), W. C. Pim (Douglas), and W. Chapman (A.J.S.).

CLUB NEWS.



The Leeds branch of the N.M.C.F.U. is a live club, judging from the turn-out for one of its recent social runs, shown above.

Marlow and District M.C.C.

This club held a successful run to Worthing on the 27th ult., starting from Marlow at 7.45 a.m., it being the first all-day run so far undertaken this year.

Pyle and District M.C.

The above club has been organised with headquarters at "Church Hall," Pyle, and is affiliated to the A.C.U. Applications for membership should be sent to the hon. secretary, Mr. A. E. Cooper, Chandos House, Pyle, near Bridgend.

Doncaster and District M.C.C.

The second general meeting was held recently at the Red Lion Hotel, about forty members attending. The club has made rapid progress since its reorganisation a short time ago, and a good social and sporting programme has been arranged. The next event will be a speed trial to be held in Stapleton Park, near Wentbridge, on the 15th inst.

East London (South Africa) M.C.C.

In the hill-climb for the Manning Trophy, held by the above club last May, W. E. Courtney (4 Triumph) made the best performance, winning the cup for the third time, and also making fastest time of the day. The results were as follow: 1, W. E. Courtney (4 Triumph); 46 secs.; 2, C. S. Morris (4 Triumph); 3, Becker (4 Triumph); 4, A. Bannock (5 Harley-Davidson); and 5, W. T. Snell (2¾ Indian).

Edinburgh M.C.

Eight teams participated in the recent trial for the Dobson Trophy organised by the above club, the holders of the cup. The event consisted of a half-day reliability trial including one timed hill (Hartree, near Biggar).

The Edinburgh Club, represented by two teams, again won the cup; the winning team consisting of A. F. Downie (2¾ A.J.S.), H. Fairley (3 A.B.C.), and G. Grinton (7-9 Harley sc.). This club also gained second place, while Peebles and Tweed Valley was third and the West of Fife Club fourth.

The route was marked by colour dropped from the preceding official car, this method proving very successful.

Wrexham and District M.C.C.

A club has been formed under the above title, and local motor cyclists desirous of joining should get in touch with the temporary hon. secretary, C. Gaffney, 52, Norman Road.

The J.B.M.C.C. (Liverpool).

One pint of petrol for solo machines and a quart for sidecars was allowed in the consumption trial held on the 23rd ult. The course was 13 9-10th miles in length with varying gradients. Results: Solo: Christian (Chater Lea) 136 m.p.g., D. O. Sullivan (Douglas) 128 m.p.g., F. V. L. Roberts (Metro Tyler) 120 m.p.g. Sidecars: Capt. Harper (Triumph sc.) 116 m.p.g., J. Bromhead (Matchless sc.) 98 m.p.g., W. Reynolds (Enfield sc.) 98 m.p.g.

Aberdare and District M.C.C.

The above club recently held its first event, when over twenty starters competed for the Illtyd Williams Trial Cup. The start took place from the Dare Valley Garage, Aberdare, and the competitors were sent away on a non-stop run to Brecon. A long easy run followed, *via* Three Cocks to Builth (lunch stop); returning to Aberdare *via* Brecon and Merthyr.

Results: first, H. Oxenham (3½ Rudge) and A. Church (3½ Sunbeam), tied; third, A. Cranch (6 Rover sc.); fourth, I. Parker (4 Triumph). The challenge cup goes to H. Oxenham, as this was confined to Aberdare competitors only.

Bath and West of England M.C.

The results of the recent twelve-hour trial to Lynmouth and back were as follow: Amateur Class.—1, E. C. Collins (4 Norton), gold medal and F.R.S. lighting set; 2, L. E. Gunning (4 Norton sc.), silver medal and prize; 3, F. Butcher (7-9 Harley-Davidson), bronze medal. Trade Class.—1, A. F. White (3 A.B.C.), gold medal; 2, E. G. Fery (4 Douglas sc.), silver medal; 3, L. C. Bird (2¾ Douglas), bronze medal.

A special gold medal was awarded to C. B. Newman, riding a 3½ Douglas, who, having cracked his piston and cylinder early in the trial, finished the course on time and successfully climbed Porlock Hill on the one cylinder.

Coventry and Warwickshire M.C.

A hill-climb is being arranged to take place at the end of August. The venue will probably be Stile Kop.

Mid-Cheshire M.C.C.

At a recent meeting of motor cyclists held at Northwich it was decided to form a club with the above title. The hon. sec. is Mr. H. Bailey, 77, London Road, Northwich, to whom all communications regarding membership should be sent.

Crewe and District M.C.

Motor cyclists in the neighbourhood of Crewe will be interested to know that a club has recently been formed for district motor cyclists. The hon. sec. is Mr. D. E. Haighton, "Stanroyd," Crewe Road, Nantwich.

Helensburgh M.C.

Recently this club held a reliability trial over a stiff course of eighty-four miles. Only half the competitors succeeded in finishing. The winner of the Prosser Cup and first prize was D. R. Tullis (3 A.B.C.), six other riders finishing in the following order: W. Carlow (7-9 Harley), A. McCulloch (3½ James), R. O. Thorburn (4 Triumph), R. Prosser (4 Triumph), J. W. Morton (4 Blackburn), and W. M. Carlaw (3½ Lea-Francis), who finished pluckily after being dogged with tyre trouble.

Horsham and District M.C.C.

A good number of members took part in the recent hill-climb held at Hurst Hill on the Ruspar Road, and a large crowd was present to watch the performances. Results: Class 1, 350 c.c.: 1st Miss A. Kent (2¾ Douglas). Class 2, 500 c.c.: 1st H. K. Knight (3 A.B.C.), 2nd L. Coppard (3 A.B.C.), 3rd A. Young (3½ Triumph). Class 3, 750 c.c.: 1st H. K. Knight (3 A.B.C.), 2nd L. Coppard (3 A.B.C.), 3rd T. J. Kent (4¼ Sunbeam). Class 4, 1,000 c.c.: 1st H. K. Knight (3 A.B.C.), 2nd W. Goodridge (6 New Imperial), 3rd L. Coppard (3 A.B.C.). Class 5, unlimited solo: 1st H. K. Knight (3 A.B.C.) and W. Goodridge (6 New Imperial), tie 36 2-5 secs.; 3rd L. Coppard (3 A.B.C.). Class 6, sidecars: 1st O. Coppard (4 Norton sc.), 2nd A. C. Coben (8 Sunbeam sc.), 3rd A. Burgess (6 Abingdon sc.).

THE HUMBER STAFF TRIAL.

Over Fifty Competitors, composed of Men who make Motor Cycles.

ORIGINATED last year as a day's sport for the works and staff, the Humber trial has become an annual event to which the contestants look forward with more than usual keenness mixed with no small rivalry. That this is so fulfils the spirit of the trial, for when works can beat the offices, or department prove its valour against department, that spirit of emulation is produced which will form the foundation of a more friendly regard.

The conditions of this year's trial, held on June 26th, were that the contestants must ride accurately to a time schedule and without stopping on any account save at controls, must climb Sun Rising and Warmington hills, and bring their mounts as slowly up Priors Marston Hill as they could.

A Big Entry.

From these rules, it follows that one stop eliminates a rider. For each of the two classes, solo and sidecar, there were cups for the best performance, but the blue riband of the event was the challenge cup for the machine which, actually owned by its rider, makes the best performance of the day, irrespective of class. There were twenty-nine solo entries, of which all but four actually started, and thirty-eight sidecars, of which sixteen did not arrive at the post.

The route to the tea stop at Banbury took the machines to Stoneleigh, Warmington, down Edge Hill, and up Sunrising, whereby disaster overtook eighteen of the competitors, while four others were eliminated by the time Sunrising had been reached.

Doubtful Watches.

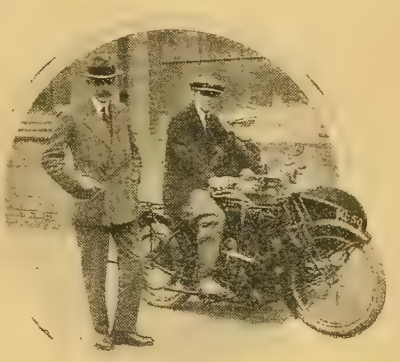
At the tea stop, the Humber band, spirited thither in the works' lorry, discoursed sweet music to a huge crowd of Banbury folk while an excellent tea was being consumed by all the competitors at the Red Lion. Some trouble was experienced owing to the antiquity of the watches used by riders, as even the minute markings were worn away by time, making the actual position of the hand a matter which only the owner could state. F. G. Suter had the misfortune to drop his watch out of its sealed case, another competitor's watch had stopped, and four of these instruments lacked seconds hands.

The Slow Hill-climb.

After Banbury came the slow test at Priors Marston. Here fate overtook a fresh batch of hitherto successful riders, and again persecuted those bold spirits, who, having already failed, and having therefore nothing to win, still were determined to finish.

On the whole the failures were numerous, but the riding of the remainder was extraordinarily fine, machine after machine literally crawling up the gradient, their barely moving rear wheels being anxiously watched by marshals who were as keen for the success of the competition as the riders themselves.

From this hill remained a long dusty, very dusty, ride to the finish at the works.



Col. Cole, managing director of Messrs. Humber, Ltd., who was keenly interested in the start of the works' motor cycle run.

The results are as follow :

50 gn. Challenge Cup and gold medal: F. J. Crundall (10 Humber car).

Solo machines: 1, H. Whitten (4½ Humber); 2, C. Merrett (4½ Humber); 3, E. L. Kemp (3½ Humber).

Sidecars: 1, H. M. Crisp (4½ Humber); 2, S. G. King (4½ Humber); 3, H. Trickett (4½ Humber).

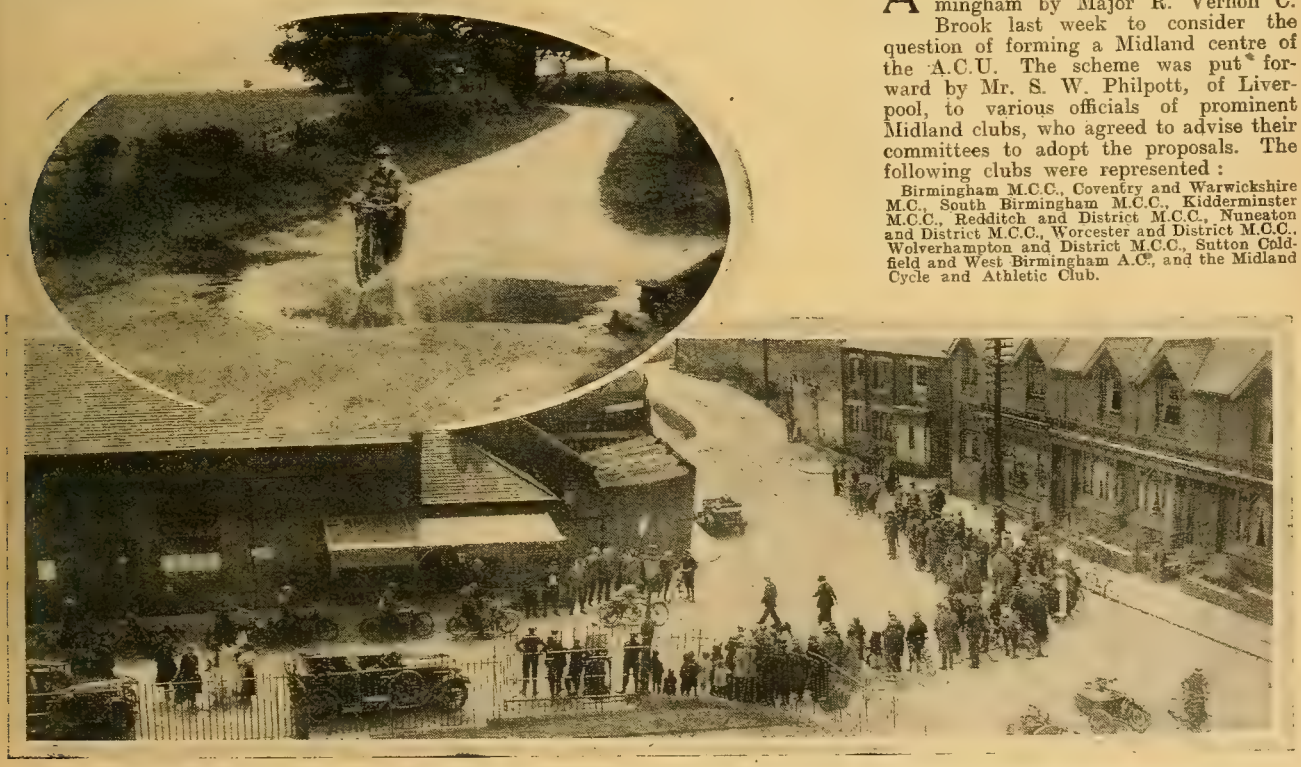
Cars: 1, H. M. Anderson (Humber); 2, W. F. Miles (10 Humber).

In the slow hill-climb H. Whitten, winner of the premier award in the solo class, was 16s. slower than a car and 20s. slower than any sidecar.

PROPOSED A.C.U. MIDLAND CENTRE.

A MEETING was convened at Birmingham by Major R. Vernon C. Brook last week to consider the question of forming a Midland centre of the A.C.U. The scheme was put forward by Mr. S. W. Philpott, of Liverpool, to various officials of prominent Midland clubs, who agreed to advise their committees to adopt the proposals. The following clubs were represented :

Birmingham M.C.C., Coventry and Warwickshire M.C., South Birmingham M.C.C., Kidderminster M.C.C., Redditch and District M.C.C., Nuneaton and District M.C.C., Worcester and District M.C.C., Wolverhampton and District M.C.C., Sutton Coldfield and West Birmingham A.C., and the Midland Cycle and Athletic Club.



Where Humber motor cycles are made—competitors being checked off at the start of the trial. (Inset) A watersplash was included in the run but did not cause any serious inconvenience.

LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

WANTED!

Sir,—In my opinion, some first-class British concern, or concerns, ought to design and produce:

(1.) A four-cylinder machine with shaft drive, three-speed gear, and triangulated spring frame.

(2.) A scooter with two-speed gear and clutch (? epicyclic).

(3.) A high-powered overhead valve, single speed, or variable speed, twin-cylinder machine of strictly moderate weight.

J. STONEHOUSE, B.A.

THE 1920 MODELS.

Sir,—Here is another victim of a new machine—turned out "anyhow." I paid £—— for an "aristocratic" motor cycle, which I believed would prove a sure thing, for I was chary after reading in your columns the laments of other riders. So I determined to spot a winner. Within a few days of delivery it was returned to the makers with an inch crack in the front cylinder (V twin), a leak in the petrol tank, which wetted my trousers outrageously, several teeth shed from the kick-starter, in which could be seen clearly a long vein of flaw, and a groove in the rear chain case, owing to faulty assembling of the stand. Not a word of regret or apology, but, of course, nearly £3 for me to pay in carriage. Within a week of the patched thing's return, the leak in the tank is worse than ever. Now I understand why I see so few machines of this make on the road.

Devon. DISAPPOINTED.

WELDING MOTOR CYCLE FRAMES.

Sir,—Your correspondent "EO 795" would give a prejudiced impression to the riding public against the welded type of joint in motor cycle and sidecar frames.

We believe that most manufacturers using this method fully appreciate the simple metallurgical facts which he states. Before adopting autogenous welding in the Ayres-Hayman we made careful tests in the laboratory, and found that the tubes (of heavier gauge than most frames) could be crushed and distorted in any direction without disturbing the weld. By the employment of intelligent, skilled welders only the damage to the tube is reduced to a minimum, and, by our special system of jointing, the stress is distributed to a portion of the tube distant from the actual joint.

It might be pointed out that in brazing practically the whole of the frame tubing is brought to a cherry heat, and the action of the spelter on the steel tubing tends to brittleness. Brazed frames are never "normalised," and malleable lugs are of much more doubtful physical structure than the pure metal deposited when welding.

Brazing was long ago abandoned in aircraft structure.

THE VIADUCT MOTOR CO.

BENZOLE AND TWO-STROKES.

Sir,—Until recently, I have been running my machine—a Chater Lea two-stroke almost exclusively on benzole, and I think my experience with this fuel may possibly interest some of your readers; more particularly those whose machines are fitted with the very excellent Villiers power-unit.

For *slow speed* town riding, I find benzole considerably facilitates driving, in that, once the engine is warm, the air lever may be left fully open, and the speed of the machine entirely controlled on the throttle, without an excess of "popping-back" at small openings.

But the great drawback, in my opinion, and the point to which I would draw particular attention, is the tendency which benzole has to exaggerate that metallic "clang" peculiar to two stroke engines at high speed.

After completing several hundreds of miles on this fuel, this high speed "knock" became so persistently annoying—even at 15 m.p.h.—that I had decided to have the engine overhauled, when, from want of a cheaper spirit, I filled up with "Aviation."

The result was amazing! The rattle entirely disappeared up to 38-40 m.p.h., and the general behaviour of the machine greatly improved.

Of course, my experience may be an isolated one, but I shall await, with interest, the views of other readers on the matter.

STANLEY J. BOND.

ASSISTING THE BUYER.

Sir,—Like many others, I have seen advertised a second-hand machine which seemed suitable, but the advertiser, unfortunately, lived too far off for me to examine the machine before purchasing.

I think those wishing to sell their machines would greatly help both themselves and prospective purchasers if they would obtain a detailed mechanical report from the A.C.U. or A.A., if they happen to be members, and state in their advertisement that they hold such a report. Prospective purchasers could then ask to see it, and safely decide without seeing the machine, if they so desired.

Machines would certainly stand a better chance of sale to distant enquirers, to the satisfaction of both parties.

Another suggestion is that the distant machine might be sent up to the nearest motor club, for the prospective purchaser to view, at his expense.

E.H.

Southport.

Among the thousands of spectators at the Tourist Trophy races were many lady motor cyclists, who had journeyed over to the Island specially to witness the "Blue Riband" event of the motor cycle world. Among them was Mrs. Louis Camm, of Blackburn, who is seen above, mounted on her two-stroke Royal Ruby.

ROAD REPAIRS.

Sir,—I was surprised to read the letter by G.H.W. in your issue of the 24th ult. Has this correspondent tried to imagine the condition our roads would be in if they were not tar-sprayed and patched? I might inform him that these are two of the principal items in the maintenance of a road. C.B.B.
Cheddar.

SPEEDS.

Sir,—The correspondence in your columns regarding high speeds on the road impressed me very much until I came up here for my holidays. In the garage where I keep my machine, I met a man who told me he could ride his Multi Rudge from here to a town eighty-four miles away in 59 *minutes!* Also that he had frequently done the same journey on the same machine, with a passenger on the carrier, in 75 minutes! A still better feat of this rider is to do a trip of twenty-four miles in *16 minutes!*

Surely Emerson, O'Donovan, NcNab, and a few others had better look out if he ever takes a run down to Brooklands—only a three hours' run for him. ELDON.
Scarborough.

TWO AND FOUR-STROKES IN COMPETITION.

Sir,—I would like to draw the attention of the framers of the conditions of competitions (more especially hill-climbs) to the obvious unfairness of cubic capacity alone, being the class unit when four-stroke engines are competing against two-stroke. Now that 350 c.c. two-stroke engines are being produced in numbers, the question, in my opinion, really requires attention. Why should the four-stroke 350 c.c. owner have to compete against a machine which (a) uses the petrol and oil of a 3½ h.p. machine (or perhaps a little more), (b) is actually advertised as a 3½ h.p. machine.

It would appear that the c.c. unit has grown up with the development of the four-stroke engine, on the principle that machines using the same amount of gas should develop about the same h.p., any differences in power obtained being attributable to good or bad design. If the two-stroke engine, by burning *an equal volume* of gas, produced more power, it would be quite entitled to compete on an equal c.c. basis, but otherwise it is unfair.

I would suggest that in any class the two-stroke engine should be allowed capacity less one-third—*e.g.*, in the 350 c.c. class no two-stroke over 233 c.c. should be allowed to compete. A.L.
Glasgow.

SPEED WOBBLE.

Sir,—It seems to me that most of your correspondents writing on speed wobble have failed to grasp the scientific points involved. They speak vaguely of gyroscopic action without actually showing how it comes into play.

Most speed wobbles are started by the machine striking some irregularity in the road. This causes the bicycle to lean over, the axle of the front wheel being forced out of its horizontal plane as in the figure, which represents side and front views of a machine leaning over to the right, from the rider's point of view.

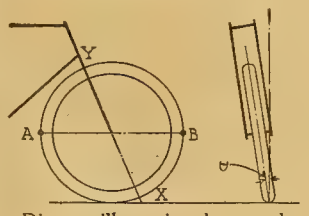


Diagram illustrating the remarks of "E4003" on speed wobble.

Consider the mass A. The wheel leans over, out of the plane of the paper. A cannot continue in its former path, but is forced outwards from paper, giving a corresponding reaction into paper. This tends to turn the wheel and forks in the steering head to the right. To correct this, one turns the wheel to the left and instinctively leans over to the left; this again causes gyroscopic action, turning the wheel further to the left. The wheel is now turned to the right, one leans over to the right, and so the gyrations proceed.

Note that the gyrations would not be started unless one leant over without turning the wheel; they continue because one leans over too far for the corresponding turn of the wheel.

It is a well-known fact that no gyroscopic action can take place without a certain amount of freedom of movement for the various axes. In consequence, machines with play in the steering head and fork spindles, whip in springs and frames, would be more liable to wobble than those without. This explains why one gets two machines of identical design—one which wobbles and one which is steady. Apparently design has little influence on wobble. E 4003.
Cambridge.

PILLION RIDING.

Sir,—I feel it my duty to inform you and all readers of your valuable paper who may find it necessary to travel through Bolton by motor cycle or sidecar that the local authorities have threatened a campaign against pillion riding, and are inflicting heavy fines against number plates being obscured or partly obscured, and in some instances I am inclined to believe that they have not been so obscured.

I therefore suggest that every motor cyclist of this town (Bolton) take particular note of all motor cycles with pillion riders as to whether the number plates are so obscured, and also note the time and identification marks, and volunteer to give evidence if their drivers are unjustly prosecuted.
Bolton. PRO BONO PUBLICO.

ROADSIDE COURTESY.

Sir,—Referring to "Chinook's" remarks in a recent issue of *The Motor Cycle*, I urge the A.A. and the A.C.U. (I am a member of both) to take the initiative and mutually agree upon and publish some simple distress signal. Such signal would then soon become universal in Great Britain.

Henceforth, until such signal is adopted, except in exceptional circumstances, I refuse even to slow down when I see others in trouble, for the following reasons:

Three or four weeks back I had about three hours for a Sunday evening run. I pulled up for the owner of an Enfield outfit, and spent an hour getting the driving wheel revolving on badly chewed up bearings and adjusting rubbing brake block from rusted up fittings. On attempting to start the outfit, I found the ignition and valves "anyhow." The gas lever refused to stay open, and the machine should never have been taken out till overhauled. I pushed the owner off, certain he could make his home. *Not even "thank you"!*

The following Sunday I stopped to help the rider of a 4 h.p. Douglas combination with lamp troubles (machine fitted with toy lamps) and broken exhaust lifter control, who accepted all help, including a new spare burner and box of matches. No offer to pay for these (though payment would have been refused), and *not even thanks"!*

I carry all reasonable spares and tools, and when I do break down, if I cannot get going alone, probably nothing short of a well-equipped workshop could help me. Therefore, in view of the behaviour of the riders who carry nothing, or only lumber and call it "spares," who do not take the trouble to understand the 'bus, and the possibility of tricks by highwaymen in these retrograde days, I will drive on, unless I am sure help is essential at that moment, until some signal is arranged. W 8406.
Sheffield.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

Issued in conjunction with *The Motor Cycle*

	Price net.	By post
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook of the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS England and Wales. Scotland. London (showing roads into and out of London and avoiding London) Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd. 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

A Technical Question.

Q. What effect does late or early timing of the valves have on the power and speed? I want maximum power at from 10 to 15 m.p.h., 26in. wheels, 19in. belt rim, and 4in. pulley.—E.W.B.

Your question covers too large a field to be dealt with here, and many other considerations are involved. Evidently, you do not follow petrol engine practice when you expect to get maximum power at from 10 to 15 m.p.h. Motor cycle engines usually develop their rated power at about 2,000 to 2,500 r.p.m., and with a gear of $4\frac{3}{4}$ to 1 this gives a road speed of 35 to 40 m.p.h.

Adjusting Countershaft Gear.

Q. Will you be so kind as to advise me in two matters concerning my 1913 Scott motor cycle? (1.) Although both my high and low gears operate, I have to maintain such a firm and continuous pressure upon the gear pedals to prevent them slipping back into free engine that I feel something must be amiss somewhere. It would be extremely fatiguing on a long run. Ought not the gears once pressed into position to remain there without the necessity for all this pressure? (2.) In the second case, I have been unable to adjust the two gear chains to equal tension with the countershaft in alignment with the engine-shaft. One chain is a Renold and the other a Brampton. Both appear in an equal state of preservation, being in very good order. Can one of the chains have stretched a half link above the other, or what is the reason?—W.M.

(1.) The trouble is probably due to the friction grip band on the outer quick thread drum not being sufficiently tight. If you screw up the nut on this arrangement until the gear operating pedal is only just free in the neutral position the gears should remain engaged without continual pressure. You would probably effect an improvement also by adding one or two thin washers on the sliding spindle through the gear axle, placing these behind the ¼in. sleeve nut which is screwed through the centre of the pedal. (2.) Evidently one chain is worn more than the other, and we would suggest that you bring the high gear chain to the correct length by removing a complete link and inserting a cranked (or half) link. Exact tension of the chains is not nearly so essential to satisfactory results as correct alignment of the sprockets.

A Traveller's Mount.

Q. I use a push bicycle to carry my samples (total weight about 50 lb.), but sometimes lose time in waiting for trains to take me on to the next town, where the "fag" would be too great to pedal. Would a motor attachment be a reasonable proposition to do the work? I could not possibly put my load on an ordinary motor cycle, and do not want to run a sidecar. I am not after great speed, but want something that can be relied on for steady, regular, plodding work, day after day, and sometimes including a fifty-mile run. Is there anything with sufficient power and durability? I should not mind helping with pedals on hills.—WHEELS.

A lightweight motor cycle with a four-stroke engine of about $2\frac{3}{4}$ h.p. would be the most satisfactory proposition for your work. Although there is no reason why the various cycle attachments should not be perfectly satisfactory, we do not think it advisable to overload these small power units.

Speed and Gears.

Q. My engine runs at the rate of 3,600 r.p.m. The two-speed gear ratio is $5\frac{1}{2}$ to 1 top gear, and 9 to 1 low. The belt rim is 20in. and the cover 26×2¼in. The belt pulley on the gear box measures 6in. across. Will this give me a speed of 70 to 75 m.p.h., or, if not, what size belt rim shall I require on the rear wheel, and will the above ratios of gear suit?—L.R.

We should have been able to work out the figures you require had you supplied us with the number of teeth on the engine and countershaft sprockets. A table of speeds and gear ratios is included in "Motor Cycles and How to Manage Them," published by Iliffe and Sons Ltd., 20, Tudor Street, London, E.C.4, by post 2s. 10d. With the engine running at 3,600 r.p.m. you cannot get a speed of 70 m.p.h. on a $5\frac{1}{2}$ to 1 gear. 3,580 r.p.m. on a $5\frac{1}{2}$ to 1 gear give 50 m.p.h., and 3,504 r.p.m. on a $4\frac{1}{2}$ to 1 gear give 60 m.p.h. To get 70 m.p.h. with an engine revving at 3,600 r.p.m. you would need a 4 to 1 ratio.

Among the hundreds of photographs taken of motor cyclists at speed, only a small percentage give a real impression of rapid movement. This illustration of R. O. Clark (Levis), near Sulby Bridge, is one of the most successful taken during T.T. week in the Isle of Man. Incidentally, Clark's corner work was wonderful.

Unaccountable Loss of Power.

(1.) Recently I had new timing gears made, which, naturally, were not marked, so I set the inlet valve to open at the top dead centre. It is fully open at 18° past top dead centre and closes 17° past bottom dead centre. The exhaust closes 20° past top dead centre and opens about 45° (not exact) before bottom dead centre. Are these correct or sufficiently incorrect to make a great loss of power noticeable? (2.) Recently I took out the machine for a test after the overhaul. There was a mysterious loss of power compared with previous experience. There is no stiffness in the engine. The spark is good at all speeds. It starts easily. No air leaks. Compression fairly good. Magneto correctly set. On the level and up slight gradients it is capable of a fair speed, but on steeper hills such as it used to climb with ease it konks in such a manner as though it were not getting sufficient petrol. The carburetter is an old type B. and B., with jet .030in. (I enlarged it from .025in. to get more power.) I cannot give any air on the level now, whilst before I could give nearly full air. There is no back pressure at the exhaust. It does not answer to retarding of the magneto. I put washers of different weights on the float to alter the level until it was almost flooded when running.—E.W.B.

(1.) The closing of the exhaust valve is somewhat delayed, but the timing is sufficiently accurate for all ordinary purposes. (2.) The jet is about the correct size, but if you cannot give any extra air it would appear that a larger one might be fitted. It is almost impossible to diagnose the trouble you describe. Apparently, some small adjustment has been neglected, which could only be traced by inspection.

IMPORTANT DATES.

Mon., July 5th, to Sat., July 10th—
Scottish Six Days Trial.

Wed. and Thurs., July 7th and 8th—
Arbuthnot Trophy Trial.

Thurs., July 15th—
Essex M.C. Joint Open Speed Trials, Westcliff-on Sea.

Sat., July 17th—
Cumberland County M.C.C. Open Reliability Trial.

Sat., July 24th—
Luton and South Beds. A.C. Open Trial at Luton Hoo.

Sun., July 25th, to Aug. 1st—
International Six Days Trial in France.

Sun., Aug. 1st, to Wed., Aug. 4th—
Anglo-Dutch Trial in Holland.

Sat., Aug. 7th—
S.A.C.U. Inter club Meet at Callander.

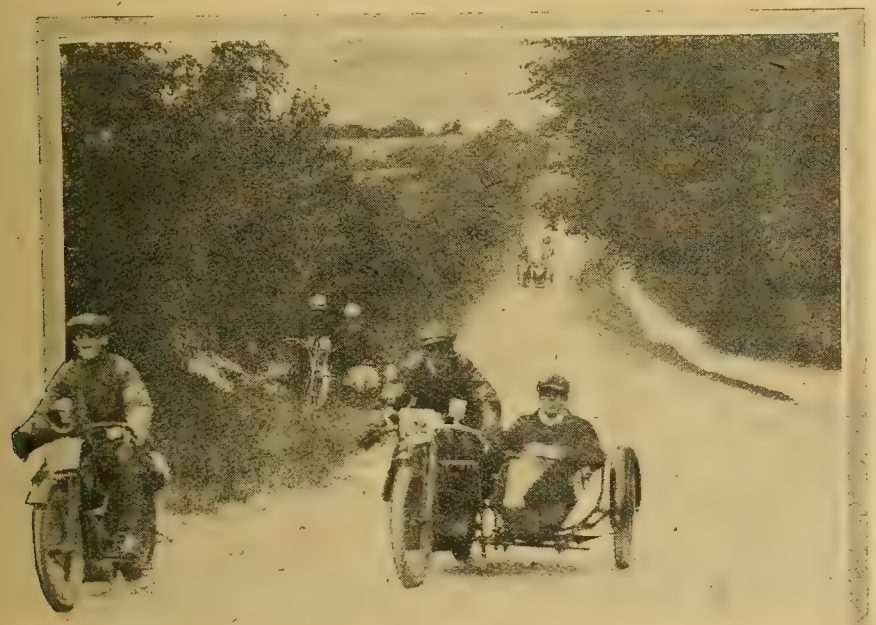
Mon., Aug 23rd, to Sat., Aug. 28th—
A.C.U. Six Days Trial.

Sat., Sept. 4th—
Scottish Speed Championships at St. Andrews
Scott Trial in Yorkshire.

Tuning a Douglas.

I wish to take advantage of your wide experience. I own a 1916 2¾ h.p. Douglas, and wish to give it a general adjusting all over. Will you tell me: (1.) Correct-sized opening for platinum points on contact breaker of Thomson-Bennett magneto. (2.) Correct-sized gap for plug points. (3.) Correct clearance between valve and tappet (when warm engine); also valve timing. (4.) I see that the jets of the Amac carburetter are numbered 24, 26, 27, and so on. What does this mean?—A.P.

(1.) About ½ mm. (2.) $\frac{1}{32}$in. (3.) Tappet clearance when warm about $\frac{4}{1000}$ths. As the timing wheels of the Douglas engine are marked, there is no difficulty in re-erecting after the engine has been dismantled; merely insert the timing wheels so that the markings coincide. You will find complete timing diagrams of this engine in the makers' handbook of instruction. (4.) The number stamped on the jet refers to the size in thousandths of an inch.



COMPETITORS IN THE M.C.C. TEAM TRIAL FOR *THE MOTOR CYCLE* CUP.
Members of the North London M.C.C. team on Whiteleaf Hill. H. J. Williams (Rudge-Multi) and R. W. Greaves (7-9 Indian sc.)

READER'S REPLY.

Misfiring Two-stroke.

I notice, by your issue of 10th ult., that "G.P." has trouble with his two-stroke missing periodically. I had exactly the same trouble with a 1919 two-stroke of a well-known make. I eventually traced the trouble to be due to too early ignition. The correct timing for a two-stroke is piston top dead centre; mag. fully retarded, points just separating—not fully open. The cause of "G.P.'s" machine missing periodically (if a shade too early timed) is probably due to the fact that no chain or set of gear wheels are absolutely true throughout the whole range of action, especially when run for some time—therefore ignition (or spark at plug) would occur earlier on some strokes, and my experience of two-strokes proves that this sometimes results in a misfire. Why, I don't know, but imagine it due to some ill effect on the plug. Retarding mag. slightly by control does not cure the trouble; retiming must be done. I strongly advise "G.P." to try timing his ignition just very slightly later than it is at present. And also to try a Lodge C9 plug. "G.P.'s" ignition timing was probably upset when decarbonising, and his trouble only manifested itself after some wear had taken place in magneto drive.—JOHN MACALLISTER (Taynuilt, Argyll).

RECOMMENDED ROUTES.

ALNWICK TO WIGAN.—A.L.
Alnwick, Rothbury, Rothley, Scots Gap Station, Kirkharle, Colwell, Challerton, Hexham, Langley, Whitfield, Alston, Penrith, Clifton, Shap, Kendal, Crooklands, Burton-in-Kendal, Carnforth, Lancaster, Garstang, Preston, Chorley, Wigan.

CHISWICK TO BARNSTAPLE.—S.A.W.
Chiswick, Hounslow, Staines, Bagshot, Basingstoke, Whitchurch, Andover, Salisbury, Wilton, Hindon, Mere, Wincanton, Sparkford, Long Sutton, Langport, Taunton, Milverton, Wivelscombe, Bampton, South Molton, Barnstaple.

OLDHAM TO SUNDERLAND.—P.P.
Oldham, Delph, Marsden, Huddersfield, Cooper Bridge, Birstall, Morley, Leeds, Roundhay, Wetherby, Boroughbridge, Dishforth, Topcliffe, Thirsk, Tontine, Trenholme, Bar, Yarm, Stockton, Norton, Wolviston, Easington, Ryhope, Sunderland.

The Irish End-to-end Trial.

Owing to the unsettled state of parts of the country through which the End-to-end riders would have to pass, this trial has been postponed until August or September.

A.J.S. Competitions Manager.

Howard R. Davies, who rode a 2¾ h.p. A.J.S. in both Junior and Senior T.T., and who is well-known as an expert competitor in trials generally, has joined the staff of A. J. Stevens, Ltd., as competitions manager.

Presentation to Mr. Chas. Sangster.

To celebrate the completion of twenty-five years with Components Ltd., Mr. Chas. Sangster was entertained at a dinner at the Imperial Hotel, Birmingham, on Wednesday last, when he was presented with a handsome piece of silver and an album containing the list of subscribers. The latter was confined to directors, managers, and employees who had been with the company twenty years and over.

The Limit in Sidecar Outfits.

When the Simplex motor attachment was in its experimental stage we jocularly remarked to the designer that eventually it would be used to propel sidecars. A London owner of one of these attachments uses a light sidecar built to carry two children, and does quite long runs on a consumption of 130 m.p.g. with l.p.a. only on the steepest hills encountered.

Touring in France.

A statement has recently appeared in the press that grey and pink cards, to be obtained from the authorities at the sea ports, will in future be necessary to motorists landing in France.

The A.A. points out that this statement is misleading. English motorists will continue as in the past to obtain the International Travelling Pass (obtainable from the A.A.), which entitles them to drive in France and most other European countries under their British numbers, with the addition of an oval plate bearing the letters "G.B." The pink and grey card will not be required by them. These latter cards are intended chiefly for American motorists who cannot get the International Pass in their own country.

Research.

The Research Association of British rubber tyre manufacturers have secured laboratory accommodation at the Chemistry Department of University College, Gower Street, W.C.1.

Remarkable Figures.

At a dinner given in his honour last week, Mr. Chas. Sangster, of Components, Ltd., Ariel Works, Ltd., and subsidiary companies, mentioned that with a capital of only £155,000, the company paid last year over £100,000 in taxation and that the turnover this year would exceed £300,000.

A Juvenile Pastime.

In various parts of the country children have resumed their activity in collecting numbers and names of passing motor cycles under the misapprehension that prizes are offered for such lists. At times these enthusiast juveniles run grave risks in their pastime and school teachers would be doing good work to point out to their pupils that no prizes are offered for the lists and that they serve no useful purpose.

Second-hand Prices.

In order to enable readers to follow the trend of the second-hand market, a brief summary of prices is given below. The figures which are taken from the advertisement columns, represent the highest and lowest prices asked by advertisers.

	Highest and Lowest.
A.J.S., 6 h.p., sidecar, 1915-16	£120–£165
,, 6 h.p., sidecar, 1919-20	£180–£250
Blackburne, 4 h.p., sidecar, 1920	£147–£160
B.S.A., 4¼ h.p., 3-speed, sidecar, 1914	£85–£95
,, 4¼ h.p., 3-speed, sidecar, 1919-20	£135–£145

Rudge-Multi, 3½ h.p., 1914-16	£60–£68
Scott, 3¾ h.p., sidecar, 1914-15	£80–£96
Triumph, 4 h.p., 3-speed, sidecar, 1918-19	£120–£140

TOURING IN THE MALAY PENINSULA.

This party of enthusiasts made a recent tour from Singapore to Kuala Lumpur and back, a distance of over 500 miles, in four and a half days. In spite of the rough nature of the roads a good average speed was maintained and no serious trouble experienced. The machines used were Reading Standard, Rover, B.S.A., Pope, and Henderson sidecar.

Chars-a-bancs.

Twenty-seven drivers of motor chars-à-bancs were last week fined at Wrexham for driving at a speed dangerous to the public.

Ex-competition Rider Married.

Sydney A. Rowlandson, who before the war was a well-known competition rider on a Rudge machine, was recently married in Toronto to Miss Marion Gibson.

Lady Doctor's Death.

We understand that the recent fatality to a lady doctor was not due to a motor scooter, as has been reported. She was at the time of the accident riding an ordinary pedal cycle equipped with a motor attachment.

All Eyes.

It was stated recently in the Doncaster West Riding Police Court that police constables are instructed to memorise the number of every motor cycle as it approached in order that the owner can be traced if it be found that the rear plate is obscured.

Found.

Mr. N. C. Chapling, of 141, Croften Park Road, Brockley, S.E.14, is anxious to find the owner of a parcel of clothing, apparently dropped by a motor cyclist, found on the road between Southend Pond and Beckenham. A tool kit has also been found in the vicinity of Pool Bridge by Mr. A. E. Flint, 7, Rockery Road, Horsfield, near Leeds.

Racing at Brooklands.

Over one hundred entries have been received for the various races, organised by the M.C.C. to be held at Brooklands next Saturday. These include several well known successful T.T. riders and Brooklands cracks, and given favourable weather the meeting should be very successful.

Speed Trials at Westcliff-on-Sea.

The Essex M.C. and Southend and District A.C. joint open speed trials, on Thursday, the 15th, include seventeen events for motor cycles for the standing kilometre, and sixteen events for the same distance with a flying start. There is also a class for three-wheel cycle cars, and ten for cars, while two events are reserved for lady drivers. The venue is the Western Esplanade, Westcliff-on-Sea.

Racing at Chatsworth Park.

Twenty-two classes comprise the programme for the forthcoming open speed trials to be held in Chatsworth Park on August 7th. Permission has been kindly granted by His Grace, the Duke of Devonshire to use the Park, and the course will be half a mile with flying and standing starts. The event is organised by the East Midland Centre A.C.U., and competitors joining one of the affiliated clubs in this area are entitled to enter at reduced fees. Motor cycles, sidecars and three-wheelers are eligible to compete, and valuable prizes will be awarded in the various classes. Full particulars can be obtained from Mr. J. Simmonds, 10, Cranmer Street, Nottingham, who will also furnish names and addresses of local secretaries of any of the affiliated clubs in the East Midland Centre A.C.U.

Cumberland County M.C.C. Open Trial.

The open reliability trial for the Alan trophy, organised by the Cumberland County M.C.C., will be held over a course in the Lake District on the 17th inst. All classes of motor cycles and light cars up to 1,500 c.c. are eligible to compete, and the start will be at 9 a.m. from the Crown and Mitre Hotel, Carlisle. In addition to the above trophy, several other cups, trophies, medals, and prizes will be awarded in the various classes. Entries closed yesterday.

Next week's issue of "THE MOTOR CYCLE" will contain a lengthy description of the SCOTTISH SIX DAYS TRIALS. Members of the editorial and photographic staffs of this journal are accompanying the competitors throughout the trial.

Powder and Patches.

The officials of the Edinburgh Club have discovered a new means to mark the routes for reliability trials. They now sprinkle coloured powder along the corners. When they returned from a recent route marking expedition the occupants of the official car presented a sorry sight. Mr. Aikman Smith, who is this year running the Scottish Six Days, was a bright yellow and quite unrecognisable except for his cheery smile.

The War Motors Association.

We are informed by the secretary of the above club that, owing to the purchase of all surplus Government motor cycles, they have but a few machines left for disposal under the special privileges and regulations of the Association. Several officers, however, of the War Motors Association are remaining in the trade, and are established at their registered offices, the Auto Traders, Ltd., 84, Jermyn Street, London, W.

We are happy to announce that the profits of this Association will be handed to the British Red Cross Society for the provision of a hospital bed.

North London M.C.C. Speed Trials.

Owing to a suitable course being unobtainable, the speed trials, arranged to take place on Saturday, have been cancelled.

B.M.C.R.C. New Press Secretary.

We are informed that Mr. F. A. Hardy has resigned the post of hon. press secretary of the above club, which he has filled since its foundation in 1909. Mr. O. E. Seyd, of the Publicity Department of the Auto Cycle Union, will in future occupy this position.

A Handsome Contribution.

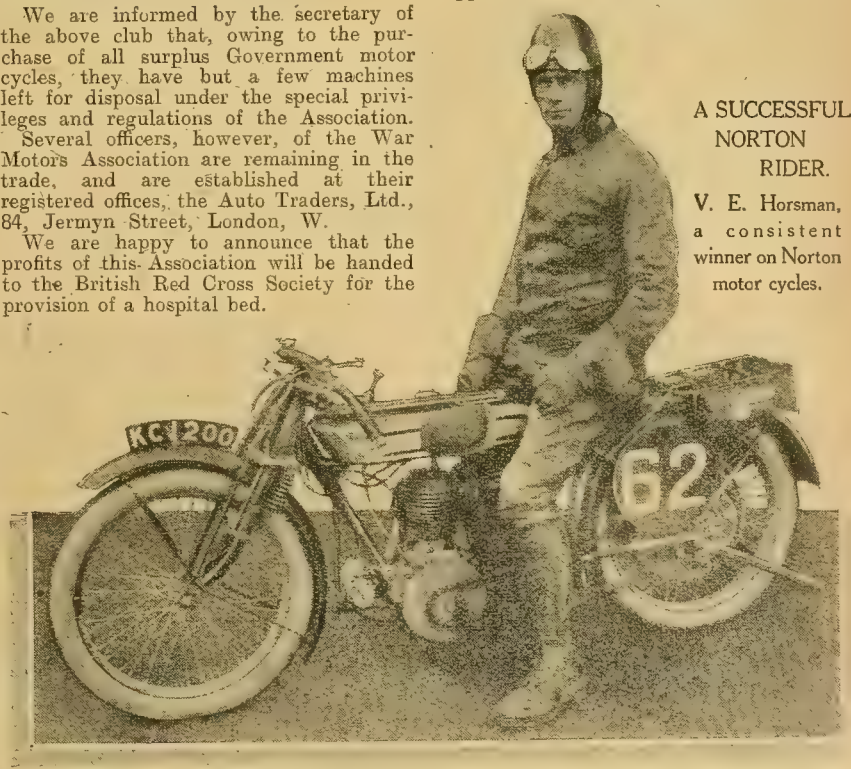
£66,810 has been handed to Field Marshal The Right Hon. The Earl Haig, representing subscriptions to the Earl's Officers' Association Fund, by the petroleum and oil companies operating in Great Britain.

International Six Days Motor Cycle Trials.

Intending British competitors in the motor cycle International Six Days Trial, to be held on a course radiating from Grenoble from 25th July to 1st August inclusive, should at once communicate with the Auto-Cycle Union, 83, Pall Mall, London, S.W.1.

The Rider Responsible?

Last week a Coventry motor cyclist was fined for riding a machine the registration number of which had not been transferred. The fact that he was not the owner of the machine, and was only trying it with a view to purchase, did not affect the matter, the magistrate maintaining that the rider was responsible. The fine was only 10s., therefore an appeal could not be made.



A SUCCESSFUL NORTON RIDER.

V. E. Horsman, a consistent winner on Norton motor cycles.

Among his recent victories in speed contests are five firsts and three seconds in the open speed trials at Storeton on 15th May, while on Saturday, 26th ult., he was placed first in the "All Comers" Handicap at Brooklands. He is seen on his I.O.M. racer.

The 1920 Scottish 6 Days Trial

94 Competitors in this Week's North-country Reliability Trial.

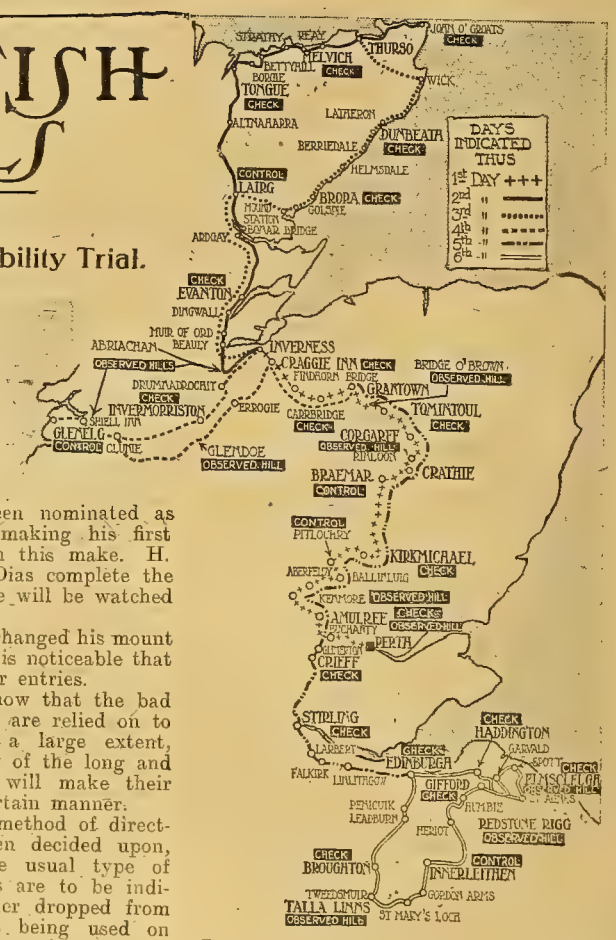
SATURDAY.

A FAIR number of competitors arrived in Perth to-day, and many of those who had taken the precaution of arriving thus early mostly spent their time in examining the famous Amulree. One of the first to arrive was J. A. Newman with his 3½ Sunbeam, on which he has travelled across France and through parts of North Africa. Mr. and Mrs. Knowles, who have elected to ride 3½ Nortons, were also early arrivals, and spent their time at minor adjustments. The Clyno and Indian teams, the Merral-Brown, two Harley-Davidsons and sidecars, a B.S.A., a Rudge, and an A.J.S. put in an appearance at the official garage, while, beside the officials, quite a few well-known faces in the motor cycle world were visible about the town. Perth, by the way, is enjoying an official holiday, all the shops being closed, and were it not for the number of motor cyclists to be seen in all parts a Sabbath calm would prevail.

A Single-geared Entry.

Campbell McGregor's 3½ Brough is one of the very few of these machines which have been turned out, the rider whom everyone will remember as one of the leading lights in the organisation of previous Scottish Trials is this year riding a single-geared machine. The flat twin engine has overhead valves, protected by aluminium covers, and a chain drive conveys the power to a clutch mounted under the bottom bracket. The final drive is also by chain, and the whole machine has a very neat appearance. Three of the new P. and M.'s have turned up, and

To-day's Test Hills: Glendoe and Mam Rattachan. Friday's Test Hill: Kenmore. Saturday's Test Hills: Talla Linns, Redstone Rig, and Emscleugh.



Alan Hill, who has been nominated as one of the riders, is making his first appearance in public on this make. H. M. Batten and J. A. Dias complete the team, whose performance will be watched with some interest.

T. J. Hutchinson has changed his mount for a 7-9 Indian, and it is noticeable that there are but few sidecar entries.

All reports tend to show that the bad roads and long mileages are relied on to eliminate machines to a large extent, though, of course, many of the long and steep Scotch gradients will make their presence felt in no uncertain manner.

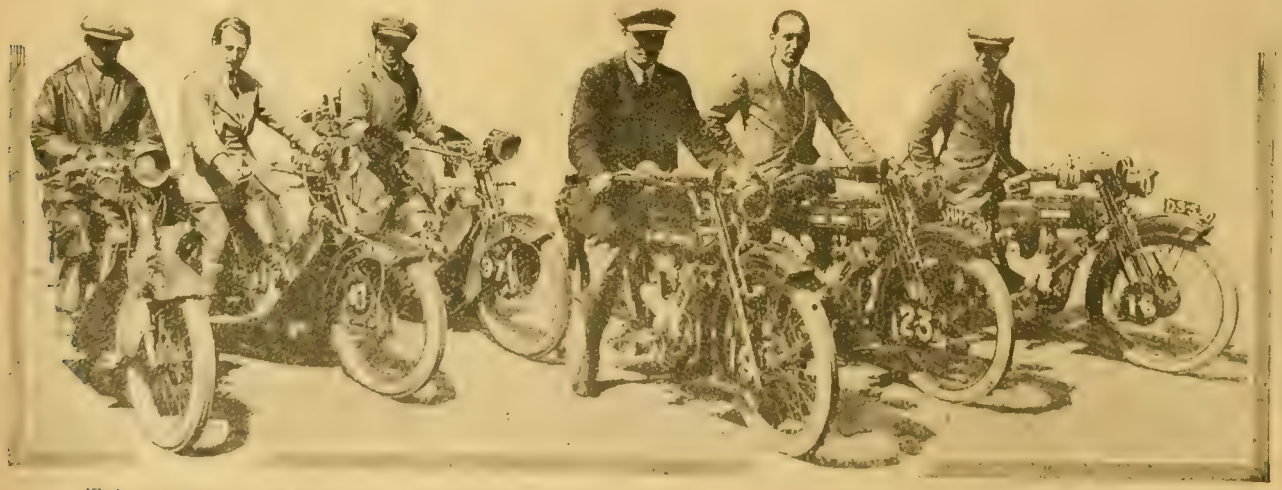
A somewhat unusual method of directing competitors has been decided upon, for, in addition to the usual type of arrows, doubtful corners are to be indicated by coloured powder dropped from a car, different colours being used on successive days so as to avoid confusion where the routes cross.

Sporting Entrants.

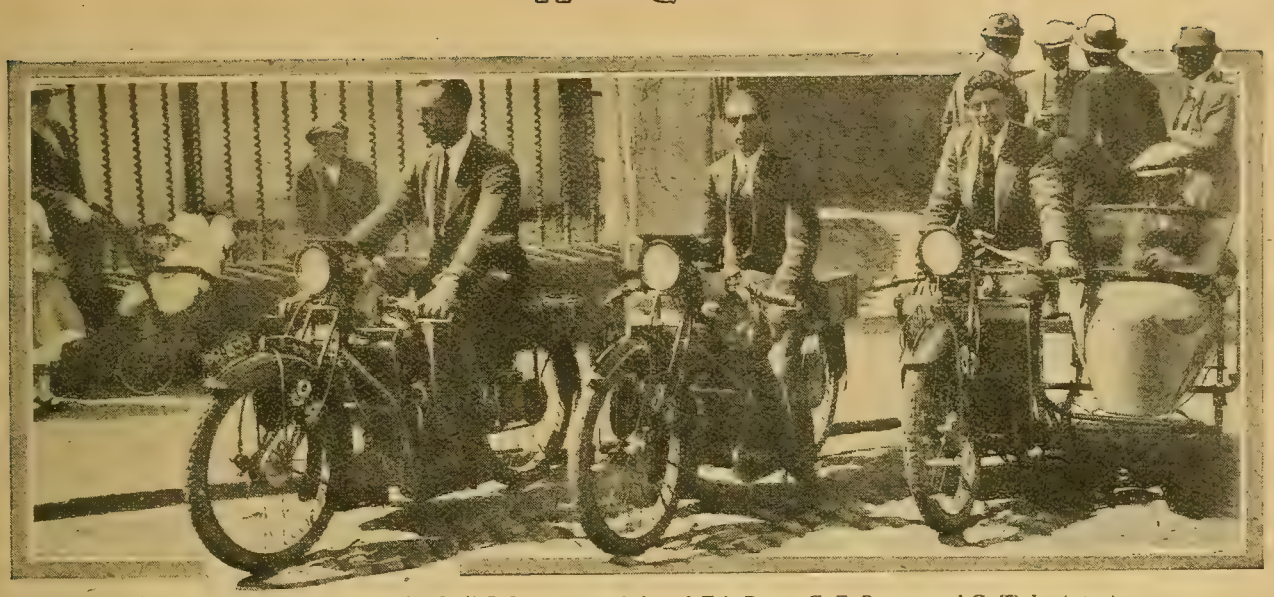
There are one or two late entries, including H. G. Sturgess-Wells, on a Rudge-Multi (who will probably be classed amongst the single-geared machines with Campbell McGregor), R. Carfrae (4 Triumph), A. G. Cocks (who is riding a Beardmore-Precision), and J. Joynson on a Coventry Victor engined machine christened the "Can'opit."

Twelve manufacturers' teams are entered and five club teams, each of the latter being distinguished by coloured number plates, whilst the single-geared entries well deserve the distinction of their bright red discs.

The evening was passed in making



Twin two-strokes and single four-strokes; the Scott and P. and M. teams. The riders are: C. P. Wood, Leslie Guy, and Jesse Baker on Scotts, and B. Alan Hill, J. A. Dias, and H. Mortimer Batten on P. and M.'s



Two solos and a sidecar comprise the A.B.C. team, consisting of Eric Porter, E. E. Palmer, and G. W. Lush (sc.)

plans for the morrow, and T. Rutherford was prominent with ideas for a trip to the hill of Kinoul. Unfortunately, there was a brush with the police, who took exception to machines standing outside the official hotel, and acted in a rather high-handed manner with regard to the scrutiny of all parts of drivers' licences. The officials have, of course, arrived with the exception of A. H. D. Aikman-Smith, who had been called away to London, and whose place as secretary will be taken by W. Frazer.

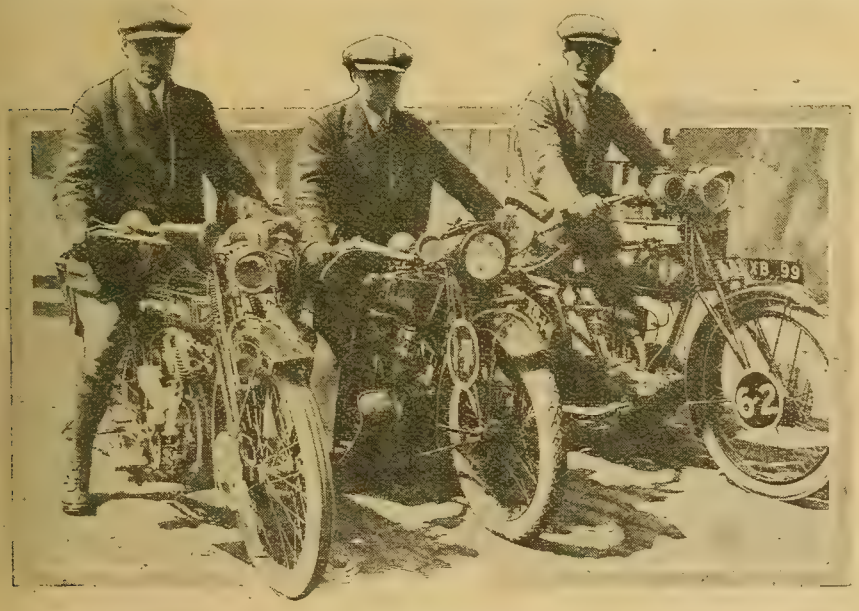
SUNDAY.

A glorious morning after a week's heavy rain raised the hopes of all concerned, and a steadily rising glass tended to confirm these optimistic feelings. Shiell's garage filled rapidly, many competitors having arrived by night trains. The Rev. J. M. Philpott, who starts No. 1, was one of yesterday's arrivals, having ridden up from the Midlands on his 2¾ Blackburne engined Wilkin.

Official Examination.

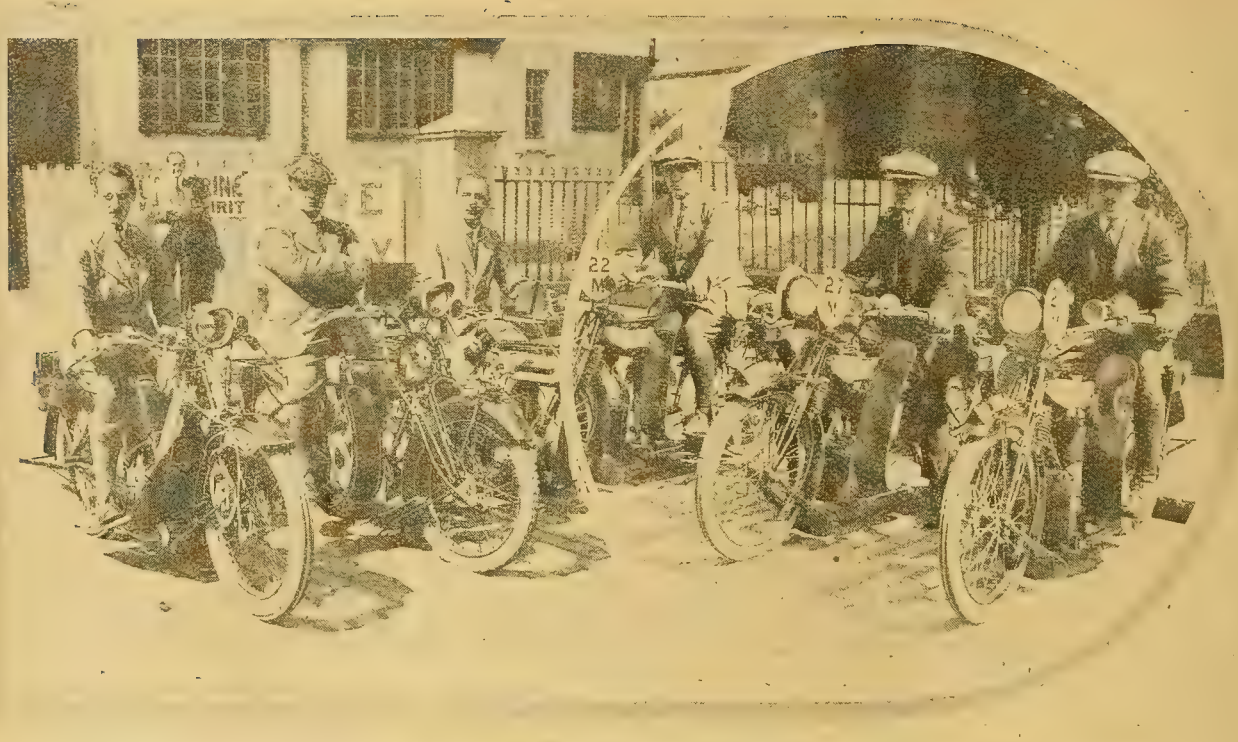
Examination and sealing started this morning amidst the usual scenes of animation and final adjustments. Reports as to the road surfaces are such as to induce riders to carry at least one spare cover, and tyre trouble seems to be the most dreaded of all minor ills. Having talked to many owners of large American sidecar outfits and watched the removal of a rear wheel in one instance, it is certainly to be hoped, for the riders' sake, that they will not have tyre troubles.

A.B.C.'s are plentiful. H. E. Fairley has fitted tin lids over the sparking plug terminals of his mount, apparently with the idea of keeping off rain and providing extra cooling surface for the central electrodes. G. W. Lush, another A.B.C. rider, has a sidecar attached, a plucky entry for a 400 c.c. mount. This is the lowest powered sidecar outfit that has ever attempted to win an award in the Scottish Trials. In 1914 there were several 3½ h.p. sidecars.



The M.C.C. team consists of B. Alan Hill (3½ P. and M.), E. A. Colliver (4 Indian Scout), and R. B. Clark (2¾ Coulson B.)

The Rev. J. M. Philpott (2¾ Wilkin-Blackburne), who drew first place in the starting-order ballot



(Left) The Westmorland M.C.C. team: Jesse Baker (Scott), T. Rutherford (Sunbeam), and W. Westwood (Triumph). (Right) The Ariel team is composed of solo riders on the new 4½ single-cylinder machines. The riders are: T. Peck, L. Newey, and J. L. Stocks.

Amongst the heavy sidecar outfits is one of the experimental 8 Clynos. This machine is very attractive with its spring frame and black and grey finish. Production models are not yet quite ready, though it is understood that it will not be long ere deliveries start in earnest. The A.J.S. are well represented. H. R. Davies is making his *début* as competition manager for this firm, and E. W. Choldcroft's 4 twin looks as smart and well cared for as ever.

Rex Mundy is riding a Reading Standard fitted with an American type flexible sidecar, which he has converted to a rigid type by a multitude of extra attachments. In addition to this, he has fitted wooden beams under each chassis member lest the conversion shall throw extra strains on the chassis and cause breakages; the work has been well and neatly carried out. Norman Black is riding his T.T. Norton, this time with a three-speed Sturmey gear instead of the Philipson pulley.

Fear of Petrol Shortage.

There is a general talk of the long stages leading to failure through lack of petrol, though comparatively few people have extra tanks. Campbell McGregor is an exception, and has a long tubular tank fitted in wooden chocks on his carrier.

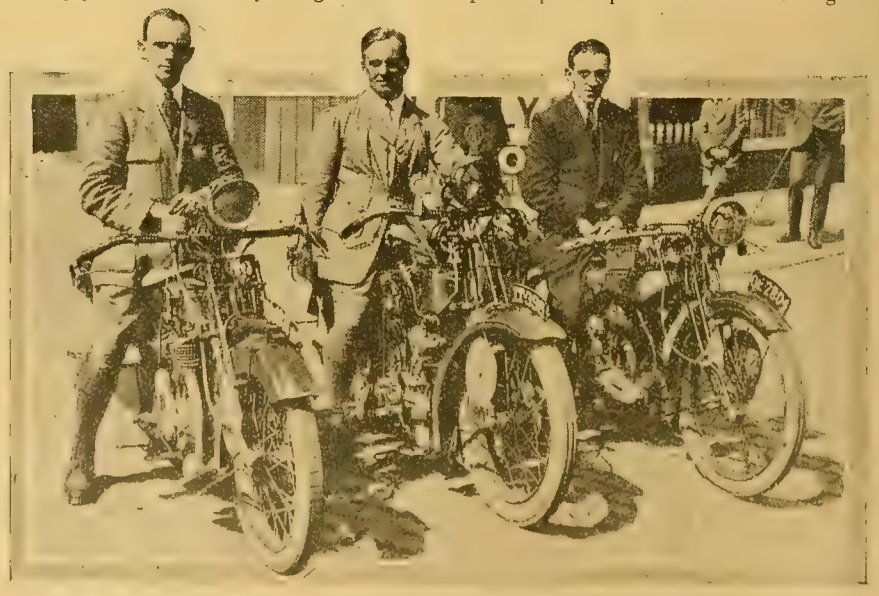
C. H. Moir has fitted a two-way tap to the oil pump on his Harley Davidson so, so that a charge of oil can be pumped into the gear box while on the run.

The Ariel team, consisting of T. Peck, L. Newey, and J. L. Stocks, look very smart and workmanlike, the machines being spotlessly clean and well protected from the mud. Jesse Baker's Scott is also particularly smart. Leslie Guy and C. P. Wood, who complete the Scott team, turned up rather late.

R. G. McEwan's 10 Richardson looks lonely amongst so many motor cycles, but the Merral-Brown and one or two Morgans will keep him company. Of the last mentioned three-wheelers, the machine driven by H. F. Barge is fitted with a water-cooled Blumfield engine, and H. B. Denley's M.A.G. engined machine has a neat exhaust heated induction pipe and a four-speed gear. The B.S.A. Co. has entered two teams, and their regular running should give them a good chance for the team's prize.

Blackburne engines are common and range from J. S. Holroyd's big 8 to a number of 2¾ engines in Verus, Wilkin, H.B. and Coulson machines. Their slow running propensities are much admired.

The Can'opit ridden by J. Joynson has a Coventry Victor engine, Sturmey Archer three-speed gear, and is made up of special parts to suit the engine.



2¾, 3½, and 4 h.p. machines are ridden by the Worcester M.C.C. Team. J. A. Newman (3½ Sunbeam), E. W. Choldcroft (4 A.J.S.), and J. W. Wills (2¾ Verus).

The 1920 Scottish Six Days Trials.—

It is a long, low, grey painted machine, and attracted some attention on its arrival.

All things being considered, there are remarkably few "gadgets" fitted to competing machines, though the special cigarette case fitted to the top tube of the Rev. J. M. Philpott's Wilkin must not be overlooked.

The Edinburgh and District Motor Club are to be congratulated on securing such a very representative entry, which included all types of vehicles which are likely to interest the motor cyclist, though with exception of two Beardmore-Precisions there is a noticeable lack of small two-stroke engines.

Everything is now prepared for to-morrow's start, and the competing machines are out of the hands of their riders until starting time. If the weather only holds like this a most sporting and enjoyable trial is a certainty, for on paper, at any rate, the organisation leaves nothing to be desired.

PERTH, MONDAY.

Considering the large entry there were comparatively few non-starters, eight only failing to face the time keeper. These riders were as follow:

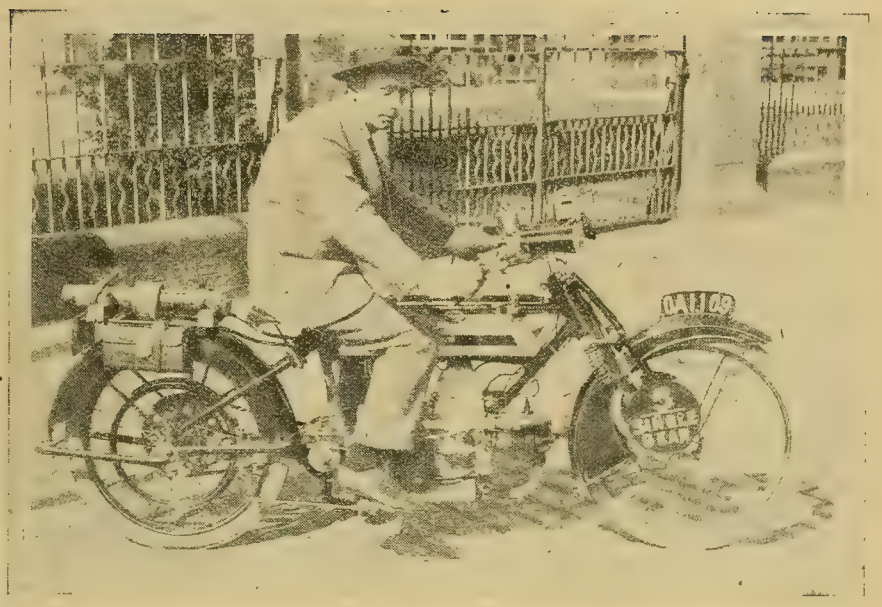
J. Robertson Brown (8 Henderson).
C. Duncan (3½ Norton).
P. W. Carter (6 A.J.S.).
S. Parker (Royal Enfield sc.).
R. Ball (3¾ Scott).
H. R. King (3 A.B.C.).
P. J. Enticknapp (4 Blackburne).
Alan Douglas (3¾ Scott).

We observed a few changes in mounts from the programme. A. G. Cocks (Beardmore-Precision) rode in place of the entry booked by the Symon Motor Co.; No. 98, H. C. S. Wells (Rudge Multi) took the place of the New Imperial entry 101; and an additional entry, No. 102, was J. Joynson (5-6 Can'opit, solo).

Other alterations from the official programme included A. B. Fairley, who was down to ride an A.B.C., started on a 2¾ Douglas, while Mr. and Mrs. Knowles who were entered on Twin Bats, rode 3½ Nortons.

Rain fell heavily during the night, but by the time the competitors lined up for the start, it had ceased, but the weather was far from bright.

The start was particularly well organised and all competitors got away well, except H. F. Barge (Morgan), who stopped and had trouble restarting outside control, and Lieut. Lochead (2¾ New Imperial) who changed a belt.

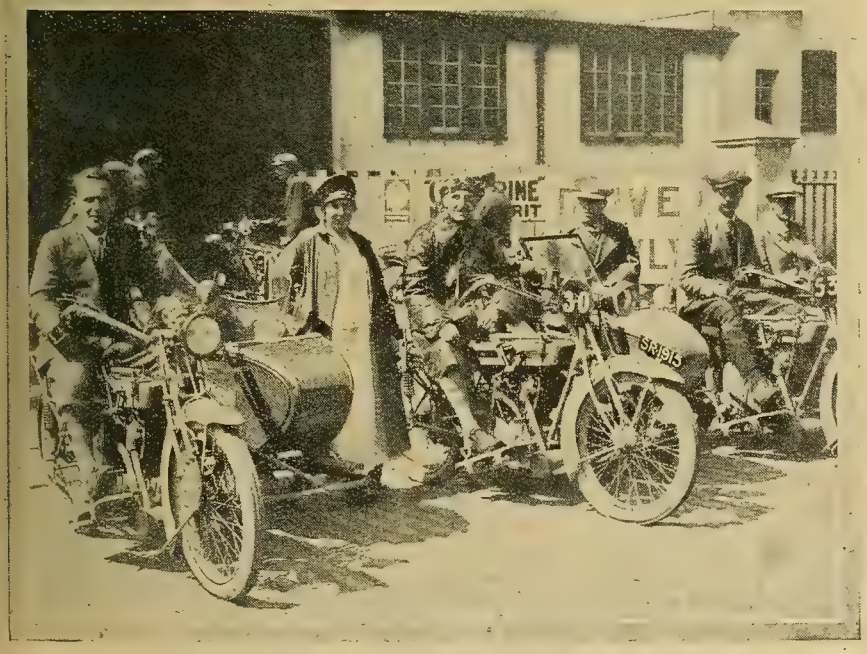


Campbell McGregor, the organiser of past Scottish Six Days, this time a competitor on a single-geared 3½ Brough.

ON AMULREE, THE FIRST TEST HILL.

Thanks to dry winds and spells of sunshine during the previous two days, the roads had improved considerably. Amulree, the first test hill, was in good condition, free from loose stones or grease and, consequently, was not a severe test for modern solo machines. Sidecars, however, found the second hairpin, which is left handed, somewhat difficult to negotiate. Near the top of the ascent grease was in evidence a few days previously, and had the bad weather continued over the week-end much more trouble would have been experienced. The descent of Kenmore was rather slimy and treacherous under the trees on the lower parts, as rain fell during the previous night.

Few solo riders had difficulty, but considerable variation in driving skill was seen. Most of the expert riders took the second bend wide. P. and M., B.S.A., Scott, and Sunbeam machines were exceptionally good. The star fast ascent was probably C. P. Wood (Scott). While the best steady climb must be credited to Cumming (Sunbeam), Bischoff (2½ Clyno) made the best lightweight ascent. The sidecars were mostly good; Matchless and A.J.S. were excellent, Moir (Harley) was very steady, but Dawson, on a sister machine, failed, as did Mundy (Reading Standard). The Richardson cycle car caused much baulking, and Holroyd (8 Blackburne sc.), who was climbing well, stopped on this account. Most competitors arrived at the foot of the hill very early and allowed their engines to cool down. The two single gear entrants both stopped, Carfrae (4 Triumph) falling on lower corner, while McGregor (3½ Brough) konked out. To summarise, the single-cylinder and flat twin machines easily outshone the other types so far as solo machines were concerned.



The Matchless team: H. Alexander, D. S. Milne, and C. Packman.

BIRMINGHAM-LLANGOLLEN-BIRMINGHAM.

A Week-end Touring Trial and an Impromptu Hill-climb on Alt-y-Bady.

LLANGOLLEN was the objective of the forty-six competitors in the Birmingham M.C.C. trial on Saturday last. Rain fell in torrents on the outward run, but nearly all arrived at Llangollen that evening. J. Allday (James) was passed near Shrewsbury with gear box trouble. A hill-climb on Alt-y-Bady was arranged for Saturday evening to determine the winners of the special awards. To render this severe climb still more difficult, competitors were required to run their engines in the free position for two minutes before receiving the signal to "Go." Not only so, but the seven-tenths of a mile of foothill preceding the gradient proper had to be covered at not more than 6 m.p.h. Couple these conditions with an almost impossible surface with large stones strewn about, and one may appreciate the severity of the climb. Small wonder then that none of the sidecars succeeded in getting more than half way up the hill, due to back wheel slip, but the best performance was credited to W. Woodcock (3½ Ariel sc.). F. W. Giles (A.J.S. sc.), who had made the best performance in the slow test, at the second attempt did much better.

Of the solo riders, four succeeded in reaching the summit, and each ascent was regarded as exceptionally praiseworthy. The quartet who shone were R. Cooke, G. Baragwanath and J. Walker, all riding three-speed Triumphs, and W. A. Egginton (4 Sunbeam). Walker's ascent was adjudged best of all.

Not satisfied with their previous day's hill-climbing, a party journeyed to the hill again on Sunday morning, when Woodcock (Ariel sc.) and F. W. Giles (A.J.S. sc.) made excellent climbs and shared an impromptu award offered by T. Stevens, whilst Kershaw (Verus-Blackburne) made a fine ascent, also Walker (Triumph) and H. Davies (B.S.A.).

The Return Journey.

The homeward trip commenced at 3 p.m., two observed hills being included. Harley Bank caused no trouble, but Lincoln Hill, near Ironbridge, is a gradient of approximately 1 in 4½, seriously to be reckoned with. Most made excellent ascents, including E. H. S. Tye (3½ single-geared Rover) at the second time of asking. This rider's hill-climbing was the surprise of the trial.

The survivors commenced to arrive at the check near the "Parson and Clerk," on the Chester Road a few miles outside Birmingham, at 8 p.m., and were mostly on time.

The following had checked in at the finish by 8.45 p.m.: H. J. Egginton (3 Enfield), W. A. Egginton (4 Sunbeam), A. H. Edwards (4¼ James sc.), E. W. Winkee (A.J.S. sc.), R. T. Cooke (4 Triumph), H. C. Jennens (3½ James), W. E. Emery (4 Rex sc.), T. F. Watson (4 Norton sc.), H. C. Hayes (3½ Sunbeam), H. H. Timson (4 Triumph sc.), T. C. Bowen (4 Triumph), J. C. Orford (2½ New Imperial), G. T. Baragwanath (4 Triumph), H. H. Saddington (5-6 James sc.), A. R. Haven, jun. (2½ New Comet), H. Boynton (5-6 James sc.), F. W. Giles (6 A.J.S. sc.), B. Kershaw (2⅜ Verus), H. P. Cutler (5-6 James sc.), W. A. Bown (2½ Bown-Villiers), R. H. Pugh (2½ Levis sc.), E. H. S. Tye (3½ Rover), A. E. Rollason (3½ Ariel sc.), H. H. Peters (4 Triumph), H. A. Pattison (4 Norton sc.), H. Riley (5-6 A.J.S. sc.), W. T. Woodcock (3½ Ariel sc.), H. Davis (4¼ B.S.A.), and H. Walker (4 Triumph). The official results will be announced later.

CLUB NEWS.

(Continued from page 42.)

Week-end Club Events.

July 10.—Northern M.C. Reliability Run.
July 10.—M.C.C. Brooklands Meeting.
July 10.—Exeter M.C. and J.C.C. Reliability Trial.
July 10.—York and District M.C. Run to Lake District.
July 10.—Dublin and District M.C.C. Hill-climb.
July 10.—Westmorland M.C.C. Speed Trials.
July 10.—North Lindsey A.C. Consumption Trial.
July 10.—Dewsbury and District M.C.C. Fitton Trophy.
July 10.—Lancaster, Morecambe and District M.C.C. Run to Settle.
July 10 11.—N. Wilts M.C. and L.C.C. Run to Clevedon.
July 10 11.—Warrington M.C. Run to Dolgelly and Hill-climb.
July 10-11.—Sheffield and Hallamshire M.C.C. Holyhead Run.
July 11.—Loughborough and District M.C.C. Picnic.
July 11.—Dewsbury and District M.C.C. Run to Buxton.
July 11.—Fleet and District M.C.C. Reliability Trial.
July 11. Streatham and District M.C.C. Run to Hailsham.
July 11. Goldthorpe and Thurnscoe M.C.C. Run to Cleethorpes.
July 11.—Bury and District M.C.C. Social Run.
July 11. Hilda M.C. and L.C.C. Social Run and Gymkhana.
July 11.—N.M.C.F.U. (Leeds). Run to Castle Howard.
July 11 Scarborough M. and M.C.C. Run to Strathes.
July 11.—Liverpool M.C. Run to Little Budworth.
July 11.—Reading and District M.C. and L.C.C. Run to Inkpen Beacon.
July 11. N.M.C.F.U. (Portsmouth). Run to New Forest and Pride Park.
July 11 Bramshaw M.C.C. Run to Isle of Wight.
July 11. North Cheshire M.C.C. Picnic.
July 11. Hull M.C.C. Competition.
July 11. York and District M.C. Inter-club Team Trial.
July 11. Lancaster, Morecambe and District M.C.C. Run to Silecroft.
JULY 15. ESSEX M.C. AND SOUTHEND-ON-SEA JOINT OPEN SPEED TRIALS AT WESTCLIFF-ON-SEA.
July 15 Bedford and District M.C. and L.C.C. Club Run.
July 15 Doncaster and District M.C.C. Speed Trials.

Southend-on-Sea A.C.

Four motor cycles and ten cars entered for the recent fuel economy trial held over a forty-six mile course between Chelmsford and Billericay. Some very good performances were put up, those in the motor cycle class being as follow: 1st H. L. Dowsett (Diamond), 163 m.p.g.; 2nd E. H. Alliott (Douglas), 122 m.p.g.; and 3rd R. Barnes (Douglas), 133 m.p.g. Their ton-mileages were 22.5, 21, and 19.2 respectively.

Lincolnshire A.C.

A members' hill-climb will be held at Station Hill, Waddington, on Saturday, starting at 2.30 p.m. Each of the five classes will be decided on the knock-out system, and a start of one yard will be conceded for the difference of every 5 c.c. less than the maximum capacity in the respective events. Prizes will be awarded to the winners in each class, also a special handlebar shield for the fastest time of the day.

Sutton Coldfield and North Birmingham A.C.

The annual hill-climb organised by the above club will be held at Stile Cop on the 17th inst., starting at 2 p.m. All classes of motor vehicles are eligible to compete in the eleven classes, which are arranged as follows: Classes 1 to 6 for solo motor cycles; 7 and 8, sidecars; 9, for three-wheelers; 10, for light car, 1,500 c.c.; and 11, for unlimited cars. All competitors must be members of the club, the annual subscription for car members being £1 1s. and motor cyclists 15s. The hon. sec. is Mr. P. Mosedale, The Nook, Sutton Coldfield.

Liverpool M.C.

O. Wade (6 A.J.S. sc.) won the Rudge-Whitworth cup in this club's twenty-four hours trial to Edinburgh last Saturday. S. Parker (10 Singer car) secured the president's prize.

Westmorland M.C.C.

Permission has been kindly granted by Lord Lonsdale for speed trials to be held in Lowther Park on Saturday, starting at 3 p.m. The following classes will be run. 275 c.c., 350 c.c., 550 c.c., 750 c.c. and unlimited solo, also 550 c.c. and unlimited sidecars.

N.M.C.F.U. (Sheffield).

A successful reliability trial was held on June 27th over a Derbyshire course, including Castleton, Buxton, Longnor, Dovedale, Youlgreave and Bakewell, and in order to make the event of a social nature each competitor had to carry a lady passenger. The best performances were made by H. Oscroft, F. A. Ward, and E. H. Danson.

Bradford M.C. and L.C.C.

The competition for the "Eric Myers Cup" took place on the 27th ult., the route followed being Boroughbridge, Scotch Corner, to Brough, and then over a further eighteen miles non-stop—fourteen miles of which was a freak course, the total distance covered being 103 miles, the competitors finishing at Reeth.

Out of forty entries, thirty-three started and twenty-seven finished. The results were as follow: 1, G. Hill (3¾ Scott); 2, H. Langman (3¾ Scott); 3, C. B. Haig (5½ P. and M.).

Hill-climb on Winding Moorland Road.

East Lancashire M.C.C.'s Successful Event on Waddington Fells.

ALMOST every big hill-climb brings to notice a rider unknown outside his own locality. George Dance startled everyone by his speeds at the first of the Stile Kop events last year—and succeeded in maintaining the reputation established on that day wherever he went. At the Isle of Man speed trials, however, he had a close rival in L. Mitchell, of Oldham, who rode a 3½ Norton. On Saturday last this rider made fastest time of the day, and won every event in which he competed in the East Lancashire M.C.C.'s hill-climb on Waddington Fells, near Clitheroe.

It was an open event of no small importance, since it was one of the twenty open competitions sanctioned by the A.C.U., and attracted 136 entries.

The course was just under two-thirds of a mile in length, and included stretches of 1 in 8 and 1 in 6, with several easier sections and sweeping bends which called for skill and an almost general use of the exhaust lifter.

Fastest Time of the Day.

Mitchell made the fastest time of the day by covering the distance in 50s., equalling 43 m.p.h. approximately.

Considering the bad weather during the preceding days, the club was extremely fortunate in having a dry, if cold and windy, day for the event.

On the Fells, the temperature was more like that generally prevailing in October than in July, and the officials at the top did not have such a pleasant afternoon as the several thousands of spectators who had come from all parts and on every make of machine to witness the event.

The course was in excellent condition, especially as the road has not been repaired since 1915. Nature and the road builder together had provided splendid "grandstands" on the high banks on each side of the winding road.

Passenger Machine Classes.

Only one light car turned up for the first class on the programme. This was a 1,370 c.c. G.W.K., which covered the course in 1m. 40⅕s., as compared with 1m. 15⅕s. taken by Carter's 3½ O.C. J.A.P. sidecar in the next event, who won this event and the 600 c.c. sidecar class that followed.

A. Horrocks, of Bolton (10 Morgan), secured first place in the unlimited passenger machine class, when his time was 1m. 9⅘s.

Lightweight Honours Well Distributed.

Following the above events were five classes for lightweights and scooters. J. Coar (2½ J.H.-Villiers) and S. A. Marks (2½ Diamond) won the two 275 c.c. classes (members and open), their times being 1m. 19⅘s. and 1m 12⅘s. respectively, while in the members' 350 c.c. class, Duxbury (2⅝ Douglas) earned first place with 1m. 12⅕s., a time greatly improved by G. S. Boston (A.J.S.) in the open event for machines of the same capacity. His time was 57⅘s.

J. F. Lidstone's 2¼ James was not in its usual form, and was apparently overgeared for the hill.

The three Autoglider scooters entered were now sent up together. The one ridden by J. A. Hebden (a seat type machine) made the best time, which, compared with orthodox motor cycles with the same power unit, was rather slow. His time was 1m. 54⅕s.

The Fastest Climbs.

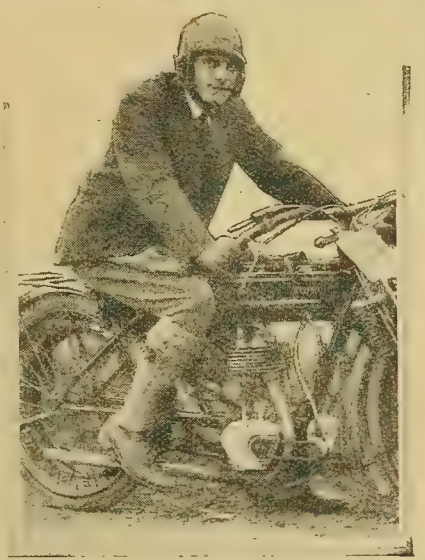
Undoubtedly, the finest riding was witnessed in the 500 c.c. and larger classes. Mitchell's success in six classes was due chiefly to his fine riding, for there were other Nortons and A.B.C. machines which were remarkably fast. Every rider had to cut out on the top bend, and the fastest times were made by those who took the greatest risks at this point.

In Class 9, for machines up to 600 c.c., Mitchell attempted to improve his 50s. in a previous class by taking the bend all out, but came near to falling. Despite this, however, his time again was 50s. exactly.

J. Whalley, of Lancaster, was a persistent aspirant for first place honours, but he was handicapped by riding standard machines. He rode well, taking the corners in good style. This rider did very well at the Southport event the week before, when he won two events and made fastest time of the day on an A.B.C.

For the Waddington event he had brought with him a 2¾ h.p. Nut, with which he secured second in Class 5, also a 3½ Norton and an A.B.C., the latter sufficiently fast to win second place in the members' 600 c.c. class.

It was a very good afternoon's sport, and a splendidly organised event, upon which we congratulate Mr. W. Geo. Guest, the trials secretary.



L. Mitchell, of Oldham, the star rider at Waddington Fells, who made fastest time of the day and won six events on his Norton.

Considering that the course was on a main road, there were very few delays through traffic. Once or twice the climbs were held up to allow cars to traverse the hill, and when a pony cart and a herd of cattle caused a break in the proceedings.

As usual, there were unthinking members of the public with loose dogs, which required the vigilant attention of the officials, for it seems difficult to make dog owners appreciate the importance of keeping their pets on the leash.

Good Riding.

Among the many other competitors whose riding stood out conspicuously we may mention the following: G. A. Strange (3½ James), R. King (A.B.C.), J. H. Hebden (3½ Norton), J. Entwistle (3½ Norton), G. E. Cowley (3½ Norton), R. Taylor (3 A.B.C.), and C. Ramsden (7-9 Rudge).

The results were as follow:

The A.C.U. Committee Meeting at Newcastle.

Lieut.-Col. A. E. Davidson, D.S.O., elected Chairman. Taxation Discussed—a Flat Rate of 4½d. per Gallon on Petrol Probable. The Question of Lighting.

CONSIDERING Newcastle is separated from the Auto-Cycle Union headquarters by some 300 miles, the second meeting of the 1920-21 Session, which was held at the County Hotel, Newcastle-on-Tyne, on Friday last, was quite well attended. Considerable credit is due to Mr. Quintin Nicol for his work in entertaining the members and arranging everything possible for their comfort.

The early part of the meeting was conducted under the able chairmanship of Mr. W. H. Wells, who read messages of regret from those unable to attend. These included the President (the Hon. Sir Arthur Stanley), Mr. S. Shrapnell-Smith, the Treasurer, Messrs. J. St. John, D. H. Noble, R. I. M. Samuel, F. H. Bevan, Otto Thomas, J. Simmonds, Duncan Watson, V. Horsman, F. A. Hardy, F. S. Whitworth, and Capt. Geoffrey Smith. He then proceeded with the first item on the agenda, the election of a chairman. It is with great pleasure that we have to announce that Lieut.-Col. A. E. Davidson, D.S.O., has been elected to fill this important post. He has been closely connected with the Union for a considerable time, having served on the General Committee for many years. His work in connection with the introduction of motor cycles into the Army and on the committee resulted in his being elected a vice-president of the A.C.U. during the war. The announcement of Colonel Davidson's election was received with applause on his occupying the chair then vacated by Mr. Wells.

An Important Amendment.

Mr. T. W. Loughborough then made an interesting statement on the questions relating to the taxation and lighting of motor vehicles. He pointed out that the Government had based their conclusions on erroneous information, and an amendment by the Motor Legislation Committee was now likely to meet with support in the House, and to stand a good chance of being passed. This amendment suggested a flat rate of 4½d. per gallon on imported motor spirit, and that the local taxation licences should be increased by 50 per cent. To this the Auto-Cycle Union agreed, but intended to lay stress on the fact that the licence duty on lightweights should remain at £1. The Secretary also pointed out that this amendment, if adopted, would bring sufficient funds to the Ministry of Transport.

So far as lights were concerned, it was proposed that motor cars should carry only two head lights of a certain power, but that motor cycles should be provided with only one head light half the power of one motor car head light. This was most unfair, and the Auto-Cycle Union had suggested that the motor cycle head light should be equal in power to one car head light. Mr. Loughborough then announced that the Ministry of Transport had stated that the matter would receive due consideration. He also referred to a model Road Traffic Bill which showed promise of being favourably received, and made, among other useful suggestions, one that the existing speed limit should be abolished and prosecutions issued only against those drivers who were alleged to have driven to the common danger. (Cheers.)

No "Champion" Scheme.

Several matters arose out of the reports of various Competition Committees placed before the meeting, and among the most important of these was the referring back of the Championship Sub-committee's report. This means that the scheme for selecting a champion for 1920 will be rendered inoperative, as it was felt that the idea would favour the trade rider and would leave the private owner quite incapable of bringing off the championship.

The question of the date of the Midland C.A. and A.C. trial was then discussed, and it was pointed out by the secretary that no change of date was possible. The explanation appeared to satisfy entirely the representatives of the club concerned who were present.

A vote of thanks was passed to the chairman and secretary of the Competitions Committee for the valuable work they had done regarding the T.T. course.

The affiliation of twenty-eight local clubs was then passed, and the new local centre byelaws approved after a few minor alterations had been made.

The question of the danger of motor vehicles equipped with the steering wheel on the left-hand side was then considered, and the following resolution passed: "That in the opinion of this meeting the use on British roads of motor vehicles with their steering wheels placed on the left-hand or near side is dangerous to other road users and should be discouraged." The resolution was strongly supported by Mr. Harry Reed, who is now motor expert to the Manchester Corporation. He subsequently told us that he had recently investigated a case in which it had been proved that the driver of a sidecar outfit after passing a tramcar had actually struck a left-hand-driven motor car before the motorist had seen him.

The last item on the agenda was the appointment of delegates to serve on the Council of the Roads Improvement Association. Messrs. T. W. Loughborough, E. M. P. Birkam Moore, and Dr. A. M. Low were selected. After hearty votes of thanks to the North-Eastern Automobile Association, coupled with the name of Mr. Quintin Nicol, and to the chairman, Col. Davidson, the meeting came to an end and the members adjourned to luncheon, to which they were entertained by the N.E.A.A. The chair was occupied by Major H. S. Streetfield, chairman of the N.E.A.A. Committee, and there were present the Rt. Hon. the Lord Mayor of Newcastle, the High Sheriff, the Chief Constable, the Town Clerk, the City Engineer, the County Surveyor of Durham and Newcastle, the Chairman and Secretary of the N.E.A.A. Motor Cycle Board, and representatives of the firms of Messrs. C. T. Malling and Sons, and Messrs. Swan, Hunter, and Wigham Richardson, Ltd.

There were no toasts and the chairman on rising said the welcome was quite an informal one, and remarked in the course of his speech that anything he might say regarding the state of the roads or the petrol tax would not influence the minds of those present in the least, and therefore he would say nothing. (Laughter.)

Civic Welcome.

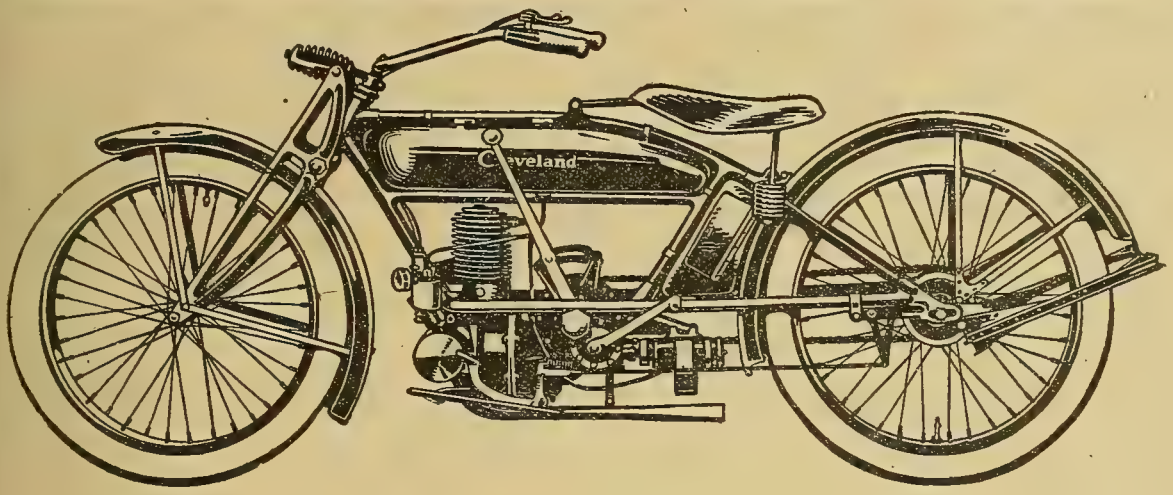
As an old cyclist, and as an enthusiastic motorist, the Lord Mayor extended a hearty welcome to the members of the Auto-Cycle Union and wished it every success.

Col. Davidson, in a brief reply—his first public speech after his election to the A.C.U. chairmanship—said he was happy to visit Newcastle in better company than on his previous stay which he had in 1911, during the Inter-club Tour between the R.A.C. and the German Imperial A.C., being surrounded with our late enemies. He thanked the chairman and Lord Mayor for their kind remarks, and Messrs. C. T. Malling and Messrs. Swan, Hunter, and Wigham Richardson for welcoming them to their works that afternoon. He also thanked Mr. Quintin Nicol for the able way in which he had organised the Auto-Cycle Union's visit.

In a deluge accompanied by thunder and lightning, the party left the County Hotel in a char-à-banc, and were shown over Messrs. Swan and Hunter's shipyards by Mr. A. Shotton, who was a most efficient guide. Later the party were taken over Messrs. Malling's pottery works, and the afternoon proved to be a most interesting one.

B.M.C.R.C. BROOKLANDS MEETING.

A very interesting programme has been arranged for the fourth members' meeting of the British Motor Cycle Racing Club to be held at Brooklands track on Saturday, July 17th. The events include ten mile scratch races for solo and sidecar machines of various capacities, and an all-comers' handicap over three laps for motor cycles of all classes and three-wheeled cycle cars. The committee of the club has given careful consideration to the length of the programme, and the start of the next meeting at 2.30 p.m., with the last race at 5 p.m. Entries for all the events close on Saturday next, and should be directed without delay to Mr. T. W. Loughborough, the Mill House, Warlingham, Surrey.



FINE PARTS—FINE WHOLE.

The Cleveland 20 is a beautiful machine to look at, but even so, the eye alone cannot find all its merits.

To know the Cleveland thoroughly, it is necessary to know the factory that makes it—the ideals of the designer, the processes of production, the tolerance on dimensions, the inspection of materials and the standards of the organisation.

Such an incidental as the thorough seasoning of cylinder and piston castings before they are machined is typical of the soundness and the care that go into the development of every part; and by insisting on this care on all the parts, the Cleveland 20 comes out of the assembly department as the sum total of its detail excellencies.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1 %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

INTEGRITY

LAYTON GARAGES

HAPPY ?

Yes! certainly we are, because of the recognition that is so continually accorded our efforts to satisfy clients.

Here is a specimen extract from one of scores of similar letters recently received :—

"It has come as a real pleasure to have dealings with you, meeting with a courtesy, by no means general in the business world; the methods of the Layton Garages are most encouraging to a prospective client.
Brentwood, 25.5.20."

BECAUSE OF THEIR QUALITY
insist on

BELDAM
Inner Tubes

THE life of your tyre depends on the quality of the inner tube. Beldam Inner Tubes are of the highest possible quality. They are built up layer by layer from the finest sheet rubber. Beldam Tubes are extremely elastic, of great strength and toughness, and, if correctly fitted, will outlast your cover.

Get a Beldam InnerTube to-day and compare it with any others you are using. You will realise at once the superior quality of the Beldam and why it wears so long.

You get them in a Waterproof Bag

Every Beldam Tube is packed in a waterproof bag, which keeps it fresh and clean and free from damage until you want it.

All standard sizes made. Write for prices.

The Beldam Tyre Co. (1920) Ltd. Brentford, Mid'x.

Taxation.

LAST week Sir W. Joynson-Hicks, M.P., Commander Viscount Curzon, M.P., and Mr. Pemberton Billing, M.P., made a strong effort in the House to bring about an alteration in the taxation proposals. It was pointed out by the Member first mentioned that he was not proposing any reduction of taxation, but merely a different mode of taxation by means of a flat rate tax on petrol. The amendment, however, was defeated 228 to 43.

Considering that motor cyclists outnumber all other users of mechanically-propelled vehicles, it was surprising that Sir W. Joynson-Hicks did not mention the hardship the proposed taxation would impose upon motor cyclists. The Hon. Baronet obviously represented private car owners, and as their representative he was defeated on his amendment. Sir Eric Geddes made it quite clear that he considered "pleasure motoring" of secondary importance.

Mr. Pemberton Billing made a strong plea for the motor cyclist, who, as a rule, only used his machine at the week-end, but without result. Motor cyclists will have to pay their full share of taxation, and to this no one can object, but they are not to be allowed to pay it in a manner which they consider fair.

We have repeatedly pointed out that motor cyclists have not been adequately represented on the Committee who prepared the report. We are told that motor cyclists were indirectly represented by the A.A. and by the R.A.C., the parent body of the A.C.U. We know that the Secretary of the A.A. has been opposed to this taxation scheme, and that he did not sign the report, but the representative of the R.A.C. did so.

Again it has been presumed that the A.C.U. through the R.A.C. was doing its best to obtain better terms for the motor cyclist, yet we find that the National Motor Cyclists' Fuel Union, which is affiliated to the A.C.U., actually supported the Government's proposals as a separate body. However, the main objection on the part of the Government to a flat rate tax on petrol is that such a tax would not bring in all users of mechanically-propelled vehicles.

The Scottish Six Days Trials.

AT the close of any important event, the remarks of the competitors may be taken as a very fair indication of the feeling towards the organisation and general success of the trial. On Saturday evening last the popularity of the Scottish Six Days Trials as a sporting event was beyond any possible question.

Long daily routes over difficult country impose a considerable strain on riders, machines, and officials, and a certain amount of give-and-take is essential if friction is to be avoided. There were grumbles—there always are—but they were few and far between, and the readiness of the officials to meet all complaints in a sporting but sufficiently firm manner went far to disarm the grumblers. The courtesy of the officials who give their time freely to further the success of the fixture is a feature which no competition rider could fail to appreciate, and this perhaps is one of the main reasons for the pleasure with which the Scottish Six Days is anticipated. Two points worthy of mention stand out prominently: each check was complete in itself, and formed a short distance trial, an entirely new section being started at the moment when the checker's sheet is signed, and thus time lost in one check cannot be regained in the next. Secondly, the high average speeds voluntarily maintained by some competitors were probably responsible for the loss of more gold medals than either hills, road surfaces, or mechanical deficiencies.

In short, the Trial discovered the good rider and machine, and eliminated the indifferent by sheer hard service, and not, as in some trials, by complicated tests decided on formula, time, and the ability of the rider as a mathematician.

An Index to the advertisements in this issue will be found on the page facing the back cover.

Motor Cycling Police?

I SEE there is a suggestion that we should adopt the American practice and mount some of our "cops" on motor bicycles. In theory the system is logical. Road follies and road crimes are generally committed far from the madding crowd, and the constable on point duty—practically the only official in definite charge of our road morals—seldom sees any worse offence than a mistake about the proper side of a refuge. On my way to and from the I.O.M., I probably saw about one hundred rather dangerous infringements of road sense, if not of road law. But 75% of them were committed by horse drivers and push-cyclists; as it happens, I did not see a single glaring offence by any motorist. If the "motor cop" comes into being, and tackles his job as his American prototype does, with the leading idea of benefiting local funds by persecuting motorists who exceed the speed limit on empty roads, he would do more harm than good. On the other hand, one can conceive that, if experienced and sensible men were employed to apply tact—and tact backed by legal authority—to all

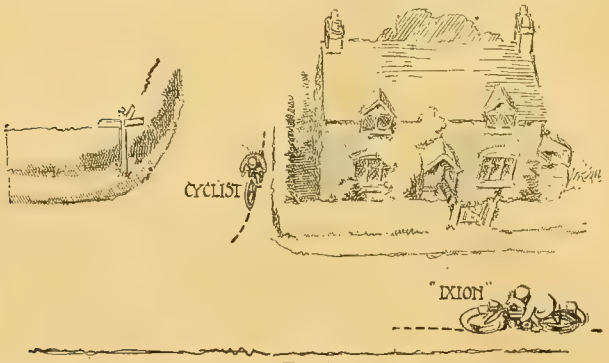

Fig. 1.

reckless or foolish road users, irrespective of whether they pushed prams, pedalled bicycles, or drove mile-a-minute motors, a great deal of good would result.

For Example.

HERE is a sample of what I mean, illustrated by a sketch of which I am seldom guilty. Fig. 1 shows the nature of the corner and the positions of a cyclist and myself two seconds before a crisis arose. The cyclist was pedalling as hard as he could go. I smelt danger and slowed right down. I do not know who possessed the right of way—perhaps some legal correspondent can inform me? There was no red triangle or other warning, though both arms of the Y were main roads. The cyclist could not stop, so it was lucky for him that I was driving sensibly. Fig. 2 shows our respective positions a second after we sighted each other—incidentally I had screeched violently on a meehorn—and he did not ring his bell. Fig. 3 shows the inexplicable course which he subsequently pursued; why he crossed over to his wrong side goodness only knows, and if I had not been driving with unusual caution, I must have run him down. Of course, I ticked him off as politely as my

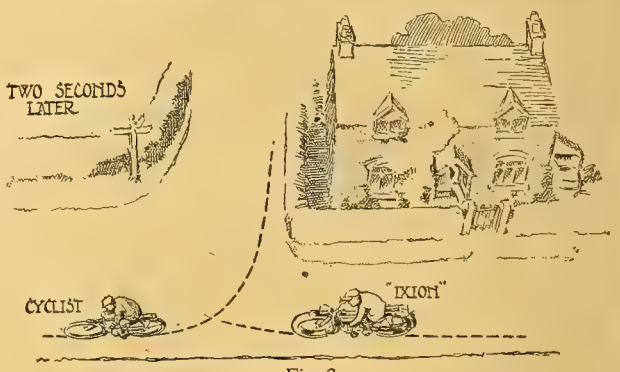

Fig. 2

famous self-control permitted, but he no doubt considers that he was nearly slaughtered by a road-hog. On the other hand, a sharp reprimand from an official road scout, armed with legal powers in the event of any back-chat, would probably have impressed this fool of a cyclist sufficiently to prevent any similar misdemeanour in future. I fancy he was simply ignorant of the rule of the road; incredible as it may sound, my own brother rode a push-bicycle for a whole year in the Manchester district without knowing there was any rule of the road.

Or Again.

NOT many weeks ago I cautiously rounded an easy bend near Exeter, on the main London road, and found a highway wide enough to take three big cars abreast completely blocked by a traction engine with two trailers drawn up alongside, and choking the fairway from hedge to hedge. There were seven men with the outfit, but it had not occurred to any of them that they had no right to blockade a public highway, and that if necessity compelled their weird manœuvre, one of them ought at least to go round the bend and warn approaching traffic. A few miles nearer town

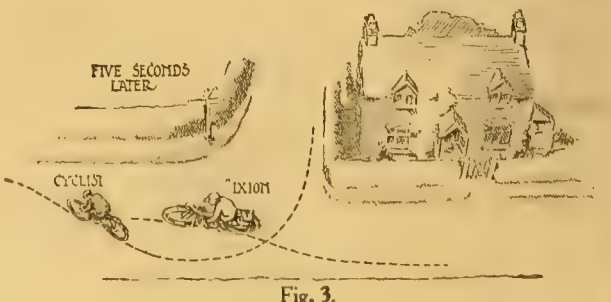

Fig. 3.

Occasional Comments.—

I passed a succession of market gardeners' vans, all on their wrong side, all with drivers asleep. On the same day I came across some dozen urchins having a mimic T.T. down a main road hill with Tate sugar boxes mounted on perambulator wheels. These are sample offences of the kind which the police rarely see. The rebukes of a passing motorist annoy rather than instruct. It is common knowledge, too, that many of our own number require repressive treatment, and it is equally common knowledge that the ordinary police trap is as useless as the number plate and licence parades to effect what is required. The days are coming when the motorist will have first claim to the roads, and the old notion that he is merely a homicidal maniac will die a natural death. As soon as this new outlook is established, the times will be ripe for the motor cyclist police. At present I fear he would merely increase the ranks of our persecutors, and would do little to reform other road offenders.

First Past the Post?

THE sensational finish of the Junior T.T. was bound to cause keen discussion, and a more precise phrasing of the rules should result. If I had ridden second to Cyril Williams, I cannot think that I should have felt any grievance. In foot racing and in boat racing it is part of the game to time one's effort so that one wins in a state of absolute exhaustion, incapable of travelling an extra 100 yards; and I do not see why a motor cycle which is built to win a five-lap race in the Island should be capable of lasting an extra lap. It is true that in this year's race the winning man and machine could not have covered an extra mile, let alone an extra lap. This is certainly cutting matters pretty fine. On the other hand, the winner had nearly twenty minutes in hand of the second machine when his 'bus gave out; and to win by a safe margin after coasting and pushing over three miles is surely sufficient proof of superiority. "First past the post" is a simple, sporting rule in such cases, which does nobody any injustice. In future years it is hardly probable that any machine will be able to win after covering three miles under man-power only; the contest will be much keener when the abstainers return to the fold. But if it should ever happen that a machine goes dud at Ramsey when in possession of a sufficient lead to push home and win, I should not grudge it the victory.

Cylinder Washers.

I CANNOT understand why the candid critics are so down on the use of paper washers for cylinder joints, whether at the base of the barrel or between the top of the barrel and a detachable head. A washer of some kind is desirable to prevent oil leaks. Given the need of a washer, a paper washer has several obvious merits. It is cheap. It seldom adheres to the parts during dismantling. It is easy to make, since an amateur can produce one by laying a sheet of paper in position, and lightly tapping round the joint edges with a small hammer; nor does paper crumble like some washer materials when one is piercing holes for the holding-down studs.

I have just dismantled an engine which employs washers of another material. They had stuck to the parts, and it took a lot of very skilled scraping to get clean faces. When I set to work to make new washers, the material was very difficult to cut to the bore, and it was impossible to get an even surface round the stud holes without a special punch, which I did not happen to possess. Consequently, I had to wait several days for a manufacturer's spare, which cost far more than paper.

IN THE SCOTTISH SIX DAYS.

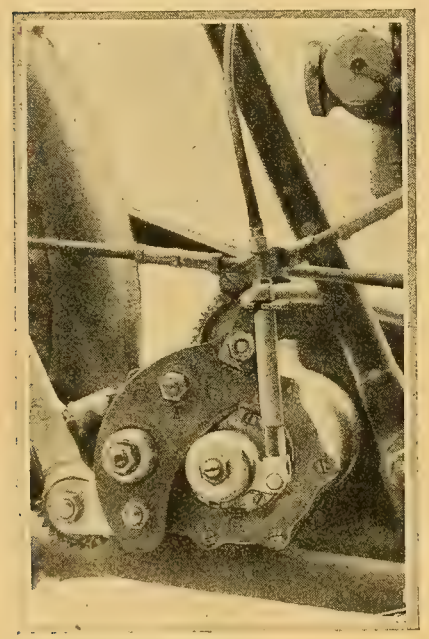
A failure on the part of a cycle car to negotiate the severe gradient of Amulree resulted in several sidecars being baulked. Observe the spare wheels and tyre on the sidecars.

A Hand Control for the B.S.A. Clutch.

A Method of Converting the Foot-controlled Clutch.

RECENTLY, a correspondent, Mr. H. Willoughby, of Nottingham, mentioned a hand control clutch operation which he had fitted to his B.S.A. machine.

So many readers subsequently wrote asking for details of this device that we invited Mr. Willoughby to furnish us with the necessary information, from which the accompanying instructions have been prepared. As the arrangement can be fitted up both simply and cheaply, no doubt numbers of riders who would prefer hand control of the clutch to foot operation will make similar conversions.



Showing the telescopic spring joint and Bowden cable fitted to the B.S.A. gear box in place of foot-operated clutch mechanism.

A Bowden clutch lever (with a ratchet) which will give at least ⅝in. movement to the cable, the necessary length of cable and casing to reach from the left handle grip to the gear box without going round any sharp corners, and a telescopic spring joint as shown in the sketch are the parts required. In fitting, proceed as follows:

Remove the foot pedal and clutch rod from the machine, and adjust the clutch screw A until the lug on the clutch dome is just below horizontal when the clutch is "in." Attach the yoke end to the lug L, and see that the pin through S and Y is a good fit, otherwise the clutch will snatch and stall the engine.

The Necessary Parts.

Make an angle piece E of mild steel ⅛in. thick and ½in. broad. Drill it to fit on the bolt, which holds the toothed sector operated by the gear lever rod. Drill it also sufficiently large for the cable to pass through, but not the casing or head of adjusting screw, if one be fitted. The exact length of the angle piece will depend on the size of telescopic joint, etc.

The control can now be assembled, and when this is done adjust the clutch by means of A until there is just the slightest amount of backlash, and so that further rotation of L in the direction of the arrow will pull the clutch "out."

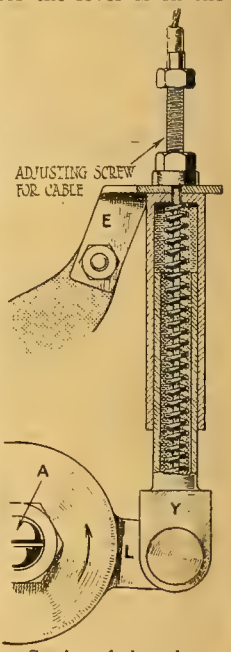
Pull the clutch "out" by means of the handle. It should now be fairly free, and will probably be as free as any clutch running in oil can ever be.

N.B.—This is only likely to be the case if B.S.A. gear oil or other thin oil is used.

Now release the handle and notice if the dome returns to its former position. If it refuses to do so, clean and lubricate the quick thread on which the dome moves. Should it still refuse to return to its former position, a stronger spring in the telescopic joint will have to be fitted.

The best position for the lever is on the left bar, so as to leave the right hand free for accelerating the engine as the clutch is let "in."

Let the clutch half "in" until the engine begins to take up the load (on low gear), and hold in that position until the machine is well under way, meanwhile accelerating the engine, and then let in completely, but slowly.



Section of the telescopic spring joint.

It is not claimed that this fitting will enable the clutch to be engaged as sweetly as a properly designed control, but Mr. Willoughby considers it much superior to the pedal.

Several garage men tried to discourage our correspondent from attempting the conversion, their answer being that the clutch springs were too strong, and would break the cable. Such an incident has not occurred, however, despite the fact that the device has been in use for several months.

Irish Motor Cycle Championship.

THE Ulster centre of the Motor Cycle Union of Ireland held a series of open speed trials at Magilligan Strand, Co. Londonderry, on Saturday, the 3rd.

Despite the fact that the venue was over sixty miles from Belfast, and that most of the competitors were drawn from that centre, there were very large entries for the five events that figured on the programme.

An international aspect was given to the meeting by the presence of George Dance, the Sunbeam super-speedman, and W. J. W. Shaw, the local crack, who won the T.T. speed trials at Douglas, and S. J. Redmond, of Dublin. Amongst the entrants there was material for sensational contests.

Sunbeam the Victor in Five Mile Event.

Dance rode in the five-mile scratch race for 600 c.c. machines, and won with ridiculous ease from Redmond and Shaw, and in the five miles for machines of unlimited capacity he was also successful, the positions of the native cracks being reversed. On this running the championship looked a gift for him, and he did the first "lap" of the five miles out and home course quite as fast as in the other race. But at the end of ten miles he had allowed Redmond to overtake him, and by the time the leaders appeared at the turning point, with fifteen miles covered, Dance had retired with a seized piston.

Indian Wins Championship.

Redmond led throughout, and ultimately won in 54 min. 11 sec., exactly the same time he accomplished in winning the race a year ago.

A handicap run in connection with the event was won by H. Chambers (3½ B.S.A.), whose father, the better known W. J. Chambers, had previously won the 350 c.c. five-mile scratch race on one of the T.T. A.J.S. machines. The results of the various events were as follow:

FIVE MILES SCRATCH (350 C.C. MACHINES).

		Time. m.	s.
1.	W. J. Chambers (A.J.S.)	5	42
2.	F. A. Newell (Verus)	6	38
3.	W. Andrews (Douglas)	6	46

FIVE MILES SCRATCH (600 C.C. MACHINES).

1.	George Dance (Sunbeam)	4	5
2.	S. J. Redmond (Indian Scout)	5	7
3.	W. J. Shand (Norton)	5	9

FIVE MILES SCRATCH (UNLIMITED).

1.	George Dance (Sunbeam)	5	4
2.	J. W. Shaw (Norton)	5	9
3.	S. J. Redmond (Indian Scout)	5	12

FIFTY MILES CHAMPIONSHIP OF IRELAND.

1.	S. J. Redmond (Indian Scout)	54	11
2.	J. W. Shaw (Norton)	55	44
3.	J. B. Johnston (Norton)	55	46

The handicap resulted as under:

1.	H. Chambers, 3½ B.S.A. (9½m.)	50	55
2.	F. A. Newell, 2⅞ Verus (18m.)	51	27
3.	S. J. Redmond, 3½ Indian (2m.)	52	11
4.	J. W. Shaw, 3½ Norton (3m.)	52	44
5.	J. B. Johnston, 3½ Norton (3m.)	52	46
6.	S. Adams, 2⅞ Verus (18m.)	55	17

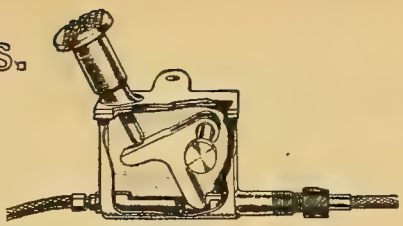
TEN MILES HANDICAP (SIDECAR MACHINES).

1.	T. Smith, 4 Norton (scratch)	16	17
2.	W. J. White, 3½ Norton (scratch)	16	41
3.	W. J. Chambers, 3½ B.S.A. (scratch)	16	55

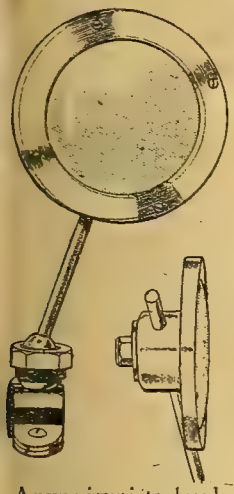
Among the Accessories.

MODERN EQUIPMENT OF INTEREST TO THE MOTOR CYCLIST.

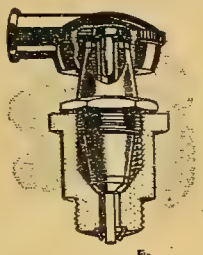
An electric horn marketed by H. Taylor and Co., Ltd., 21a, Store Street, W.C.1.



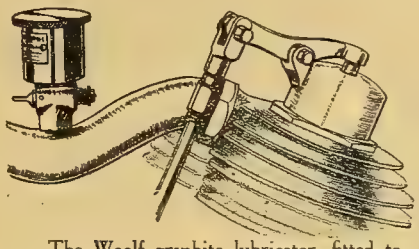
An accelerator pedal for motor cycles introduced by A. F. Edwards, 25, The Burroughs, Station Road, Hendon, N.W. It is, of course, most suitable for use with a single-lever carburetter, but can be applied to the two-lever type.



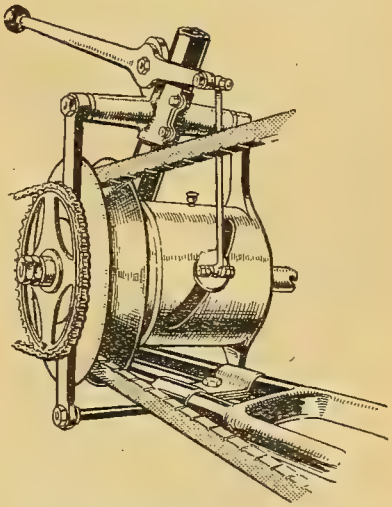
A new mirror introduced by the Westwood Rim and Patents, Ltd., Lawden Road Foundry, Bordesley, Birmingham. It has a ball joint, which permits it to be placed in any desired position and angle.



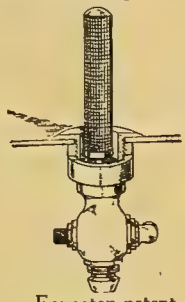
The new W.M. type Forward plug, made by the Forward Sparking Plug Co., Summer Row, Birmingham. It can be taken apart completely for cleaning.



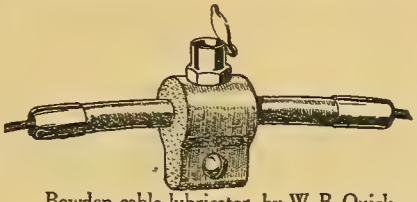
The Woolf graphite lubricator, fitted to the induction pipe of a motor cycle engine. It is marketed by Graphite Products, Ltd., 218-220, Queen's Road, Battersea, and is intended for use with a composition known as Foliac. It is claimed that it gives a glass-like surface to all frictional surfaces.



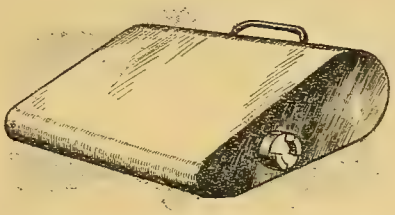
The latest Grado pulley intended for a countershaft position on single-geared two-strokes. Its price is £12.



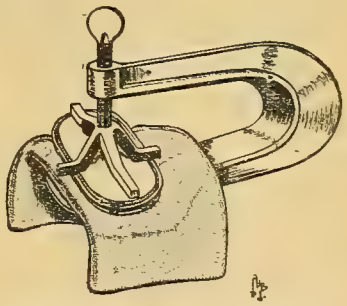
Errington patent filter, brought out by the Accessories Supply Co., 15, Brownlow St.W.C.



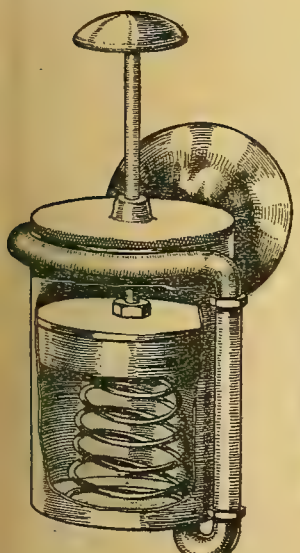
Bowden cable lubricator, by W. B. Quick, 31, Fitzhamon Embankment, Cardiff. The price of the fitment is one shilling.



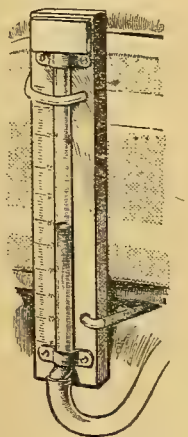
Easting's spare petrol carrier, which can be used as a footrest in the sidecar. Made by the windscreen house at 132, Steelhouse Lane, Birmingham.



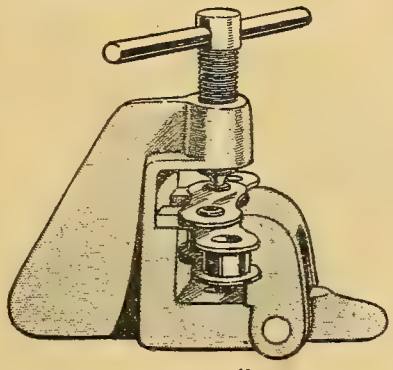
The Lightning Vulcaniser, marketed by F. W. Woolworth and Co., Ltd. It is small enough to be carried in the toolbag, and is sold at the low price of one shilling.



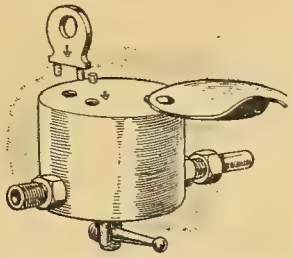
To operate reed horns by pressure pump. This device is the patent of Mr. R. W. L. Mottram, of Llanberis, Allesley Old Road, Coventry. He is open to negotiate with manufacturers for its production.



The "Highlow" petrol consumption gauge, marketed by Messrs. Herrtage, Holyoake & Co., 127, Fleet St., E.C.4.



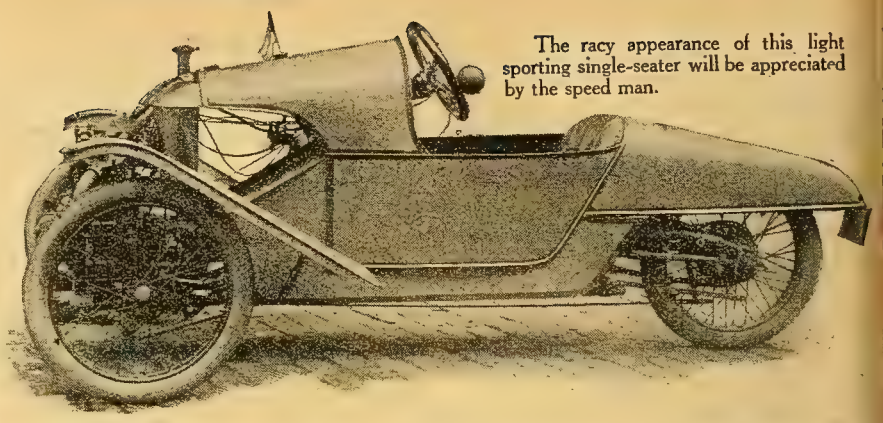
The new Hans Renold rivet extractor has a swing arm, which centres and holds the chain link, and so greatly facilitates operation.



The Ace petrol tap lock, devised by Mr. L. Deacon, 50, Gipsy Hill, Upper Norwood, S.E.19. Mr. Deacon hopes to meet with a manufacturer who will take up its production commercially.

A SPORTING MONOCAR.

A Single-seated Morgan, built to the Owner's Special Design.



The racy appearance of this light sporting single-seater will be appreciated by the speed man.

IT is the ambition of many motor cyclists to have a fleet of machines in order to have one for every purpose. One of our readers owns two Morgans and a solo motor cycle, but all are on sporting lines.

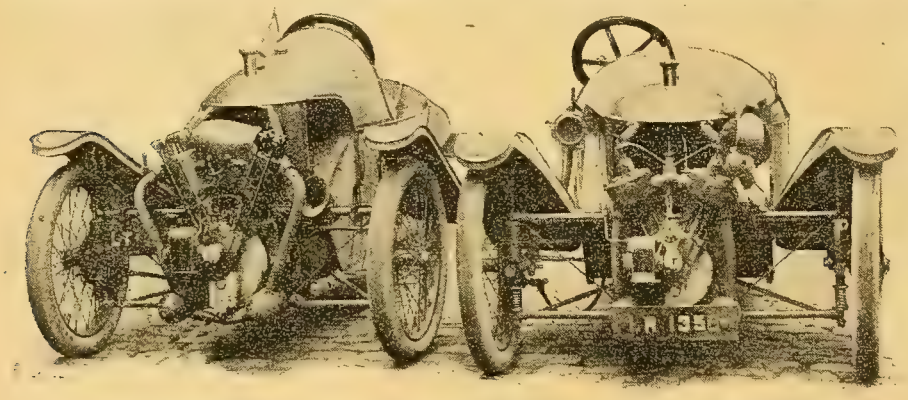
On this page his two G. P. Morgans are shown, of which the single-seater is perhaps of greatest interest. The body is 21in. wide, and the scuttle is of exceptional depth and height, a specially narrow and high radiator being fitted to follow out the streamline effect.

The owner wishing to eliminate the windscreen had the dash made several inches higher than standard, and so successful was the innovation that the owner found it quite possible to smoke comfortably at 50 m.p.h. The seating position is such that the driver is given a clear view of the road ahead through the "slit" between the rim of the steering wheel and the top of the dash.

With regard to the engine, this also is special, and consists of an overhead-valved 90 × 85 mm. J.A.P. (1,082 c.c.). This engine is not very well known, as we believe only a few were manufactured. It is excellently balanced and splendidly made, and gives nearly 20 b.h.p. at 2,500 revs. Although the valve springs have very high tension, the valve gear is unusually quiet for this type of engine. Originally the compression was 100 lb. p.s.in., but this proved extremely destructive to plugs and rendered starting difficult. Washers, $\frac{1}{8}$in. in thickness, were accordingly fitted, with excellent results, and, even with this reduced compression, the speed and acceleration are considered ample. The oil consumption is phenomenally low, and the petrol consumption varies from 40 to 60 m.p.g., according to the make of carburetter fitted. A pilot jet, B. and B., suits the engine extremely well; it gives high speed and exceptionally slow "tick-over" in neutral.

The standard two-speed gear box gives ratios of $3\frac{1}{2}$ and 6 to 1. On the dash board are two eight-day clocks, speedometer, and revolution counter, the latter being a very useful and interesting fitment.

In designing the outfit, it was feared that the machine would be unstable owing to the absence of weight in the rear portion, but experience has shown that it is extremely steady on grease, tramlines, etc. The steering, in fact, is excellent, and this we attribute to the exceptionally heavy engine fitted. Although the frame has not been reinforced, no distortion has occurred during 6,000 miles running over the war-worn roads of this country.

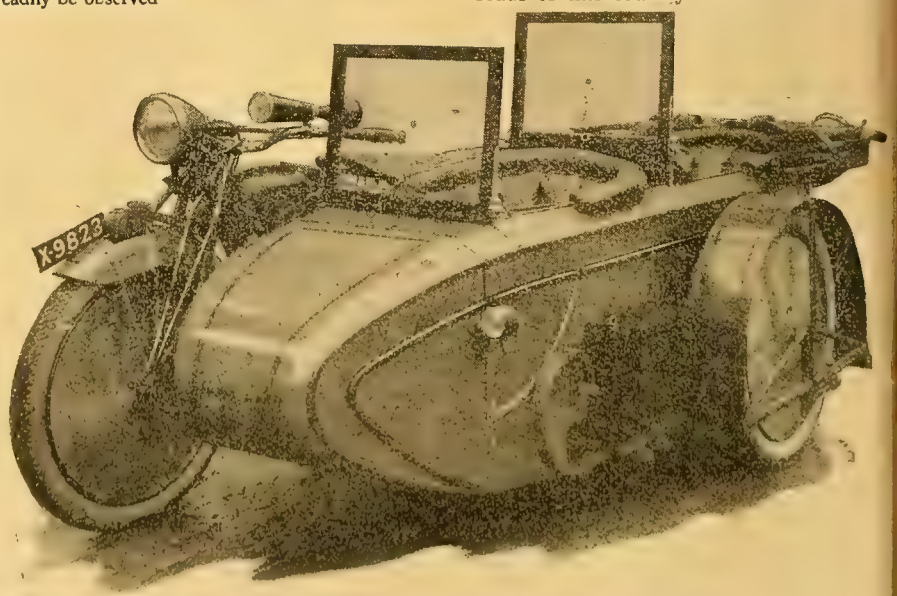


The single-seater Morgan alongside the Grand Prix Model. The various differences of design will readily be observed

A SIDECAR HIRE SERVICE.

FOLLOWING the excellent example of enterprising motor cyclists who, some time ago, placed a sidecar taxi service on the streets of Paris, the X Motor Cycle Co., Torquay, have recently taken over a novel sidecar designed by Messrs. Robertson Motors Ltd., 157 B, Great Portland Street, London, W.1, and propose to establish a private hire service equipped with twenty of these vehicles. This two-seater sidecar, which is attached to a 7-9 h.p. Excelsior motor cycle, amply accommodates two persons, and provides for each sufficient leg-room and space in the seats to ensure the maximum comfort on a long tour.

The X Motor Cycle Co., are prepared to supply these machines, which will be equipped with a luncheon basket and a camera at a fixed rate of 8d. per mile, or for one day of nine hours for the inclusive price of £2 17s. 6d.



A two-seater sidecar used for private hire service by a Torquay garage

THE ARBUTHNOT TROPHY TRIAL

The winner, on his Sunbeam, and a Wooler rider on the bad surface of Salt Box Hill.

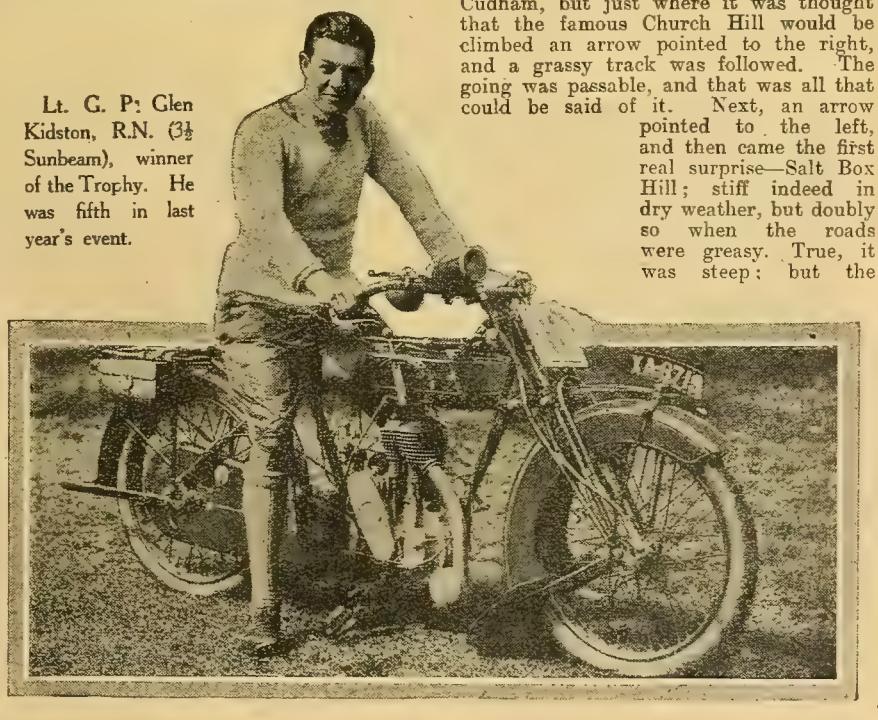
FOUNDED to commemorate the glorious death of Rear-Admiral Sir R. K. Arbuthnot, that gallant motor cyclist who did so much for the movement in its early days, the trial for the trophy of his statuette, executed by Lady Scott, is unique.

First, it is the only trial of which we are aware which is for solo machines only, and secondly, it is the only one confined exclusively to officers of the Royal Navy. This year the entries were better than last, but unfortunately the Fleet mobilisation and the trouble in Ireland and the East seriously affected the entry. Although the competition received the official sanction of the Admiralty, nine entries were lost from Keyham, and probably more from officers taking a course at Cambridge, and these naturally helped to spoil what would otherwise have been a good entry.

First Day's Run, 126 Miles.—Winding Course over the North Downs to Reigate, then to Guildford, Godalming, and Hindhead by a Circuitous Route.

Of the twenty-one riders appearing in the programme, fifteen started from Purley Corner at 10 a.m. on Wednesday. The weather was most unpropitious, as rain fell at the start, continued most of the morning and fell again heavily during the afternoon.

Mr. T. W. Loughborough, secretary of the Auto-Cycle Union, as usual, displayed wonderful ingenuity in devising a really stiff course, the difficulties of which were enhanced by the bad weather. To explain this course in detail would involve much space, and would leave the reader in comparative ignorance and complete confusion, while its appearance on the map, to quote Mr. Ebblewhite, the timekeeper, whose wit is proverbial, resembled "a worm in agony." It twisted and turned with diabolical ingenuity and included every hill of note on the North Downs, from a point east near Cudham to a point in the west near Guildford. Besides these there were the ascent of Bright Street in Guildford itself, and the hairpin near Godalming.



Lt. G. P. Glen Kidston, R.N. (3½ Sunbeam), winner of the Trophy. He was fifth in last year's event.

Unfortunately, the arrowing was not too good, owing to the sidecar outfit told off for this duty failing to carry it out owing to magneto trouble, and several men left the route for this reason. The course was exceedingly pretty, the first part passing through leafy lanes, with trees overhanging the road almost brushing the competitors.

Narrow roads were followed leading to Cudham, but just where it was thought that the famous Church Hill would be climbed an arrow pointed to the right, and a grassy track was followed. The going was passable, and that was all that could be said of it. Next, an arrow pointed to the left, and then came the first real surprise—Salt Box Hill; stiff indeed in dry weather, but doubly so when the roads were greasy. True, it was steep; but the

Arbuthnot Trophy Trial.—

trouble was not the gradient, but the difficulty of adhesion, and many a good mount failed because the rear wheel would not grip. Glen Kidston, our star naval competitor, well in the running for the trophy, failed for this reason. He was riding a 3½ h.p. Sunbeam.

E. H. Mann (2¾ Wooler) also failed, but Lawder (3 A.B.C.) and W. E. V. Bashall (A.B.C.) made surprisingly good ascents. K. B. Wilson (2¾ Douglas), although he wobbled all over the road, owing to the atrocious surface, came up very well. G. Plumer (6 Zenith) passed us going well, but P. H. Back (4 Triumph) touched the ground with his feet, R. C. Hovenden (8 Zenith) ran into the bank, H. L. S. Baker (4 Triumph, single-geared), F. G. Emley (8 Zenith), and C. J. M. Hamilton (2½ Levis) were also among those who failed.

The course was of so complicated a nature that it was possible to cover it all and see everything of the trial, but it was most productive of incidents and provided plenty of "fun," especially for that brave man H. L. S. Baker—No. 13—who rode a 4 h.p. *single-geared* Triumph, and at the end of the day wrote on his non-stop card "failed on all decent hills." He is one of those people who will not admit that motor cycling provides no exercise.

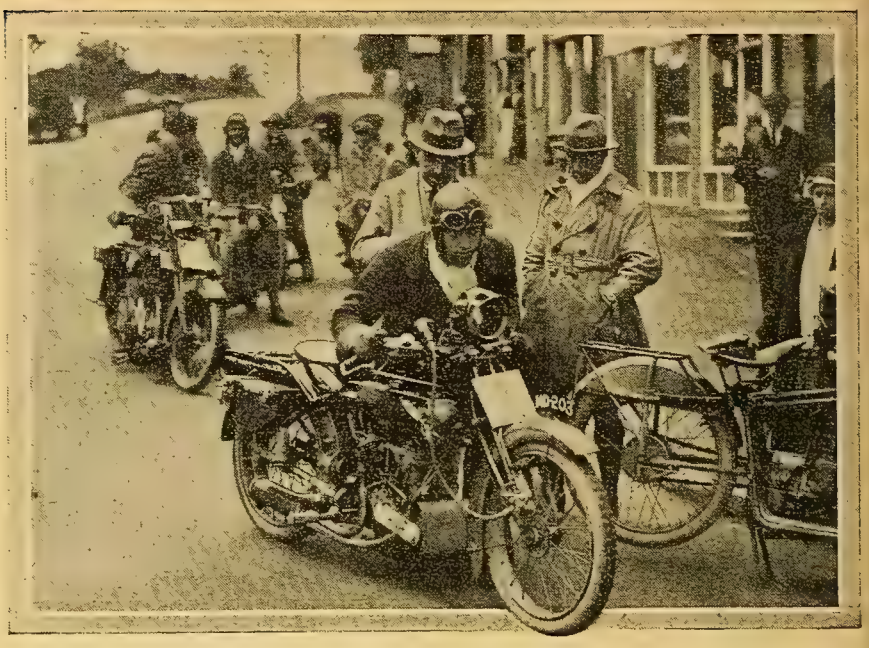
Bad Hills and Weather.

Leaving Salt Box, such hills as Polsteepie, Cudham, Brasted, and Westerham were climbed. The exceptional weather caused certain hills to be eliminated, but their loss was hardly noticed. In the neighbourhood of Woldingham what was probably the worst hill of all was encountered. This was Camp Hill, with a hairpin bend at the bottom, a good gradient and a bad surface.

There is quite a good rise through the woods from the Caterham valley to the Warlingham plateau known as High Lane, and just as we arrived at its crest, P. F. F. Browne (Norton), Kidston (Sunbeam) and Lawder (A.B.C.) arrived and came up well. Poor No. 13 skidded and fell, breaking his front mudguard. T. H. Back (Triumph) and W. E. V. Bashall (A.B.C.) came up magnificently—especially the latter, whose performance on every hill was splendid. The machine steered perfectly, except on muddy and stony surfaces, and it was beautifully handled. C. J. M. Hamilton's Levis just got up.

Even at this early stage signs of wear and tear appeared on the machines; but not what might be described as "fair wear and tear," but petty damage due to sideslips and spills. Hovenden (8 Zenith) climbed the gradient well, flooding his carburetter. The next place where we saw him was on Succombe Hill, which he made about six attempts to climb. It proved a severe trial to many, especially to one who took the wrong turn at the top, came down Bug Hill again, and again up Succombe, and on three times.

At the top of Wray Lane, near the summit of Reigate Hill, we came upon Mr. Greenhill's car carrying Col. Davidson, D.S.O., R.E., one of the judges, and *The Daily Mirror* photographer, whose ambition in life is not, apparently, to show the public how good a means of locomotion a motor cycle provides, but to take pictures of tumbles. He was disappointed, as he arrived too late to take Back, who had just skidded, broken his front number plate and bent the mudguard. F. G. Emley (4 Zenith) failed. He had broken a belt for the first time and retired.



Leaving Hindhead after refilling: Sub-Lt. R. Whitcraft (Zenith) followed by Lt. Glen Kidston.

Temporary Repairs.

Lunch was served at the White Hart Hotel, Reigate. At lunch time it was announced that P. F. F. Bourne (4 Norton) had retired owing to a damaged rear brake. Hamilton's lamp was adrift and made fast by string, while his footrests were badly bent. Hovenden's Zenith had his crank case drain plug carried away through striking the ground, and he successfully stopped the hole with a cork.

More hills, and still more hills followed after lunch. There were some old favourites among them, notably Pebblecombe, which, of course, accounted for poor No. 13, as well as R. V. Mack (2¾ Wooler), and E. Mann, who was similarly mounted. Bashall, on the A.B.C., soared up without effort, and shortly after came the A.B.C. rider, James, who had retired owing to various troubles. Wilson's Douglas made an excellent climb, while Plumer (6 Zenith) and Back (Triumph) came up well, as did Kidston (3½ Sunbeam), Wilson (2¾ Douglas), and Hovenden (8 Zenith).

A scene at the replenishment depot at Hindhead

rbuthnot Trophy Trial.—

Coombe Bottom Hill was the other old riend, and was utilised instead of White-owns, as the weather proved to be too ret for its chalky surface. The few ours respite from the rain soon came to n end, and the afternoon was wet right p to the finish.

The surface low down on the hill was oose and soft, but at the corner, which s loose in dry weather, it was smooth and rm. The first man to arrive was Whit-roft (Zenith), who wobbled badly, but nade a clean ascent. Lawder (A.B.C.), Kidston (Sunbeam), and Bashall (A.B.C.) learly made the star climbs, while Wil-on (Douglas), Plumer (Zenith), and Back (Triumph) performed well. After arious detours the survivors reached Guildford, and were sent up Bright Street n the town, last used as a test hill in the urbiton Club's team trial. It proved the ndoing of many, and only Lawder A.B.C.) and Kidstone (Sunbeam) made lean climbs. The next incident was the airpin corner at Godalming, which was ot very serious, and after a short spell n the rain the first day's run (126 miles) ame to an end.

"A Lodging for the Night."

The headquarters offices were at Wood-erry Hotel, where the machines were tored, but competitors were billeted in arious places. Baker, the man with the nlucky number, had his front mudguard arried away, and arrived with his face s black as a nigger. He had, therefore, o put up with much merciless chaff, hich he took most good humouredly.

Twelve competitors in all completed ne course at the end of the first day, nd none with clean sheets. The follow-ng is a record of their performances :

Lt. R. V. Mack, R.N. (2¾ Wooler). Stopped on ll test hills.

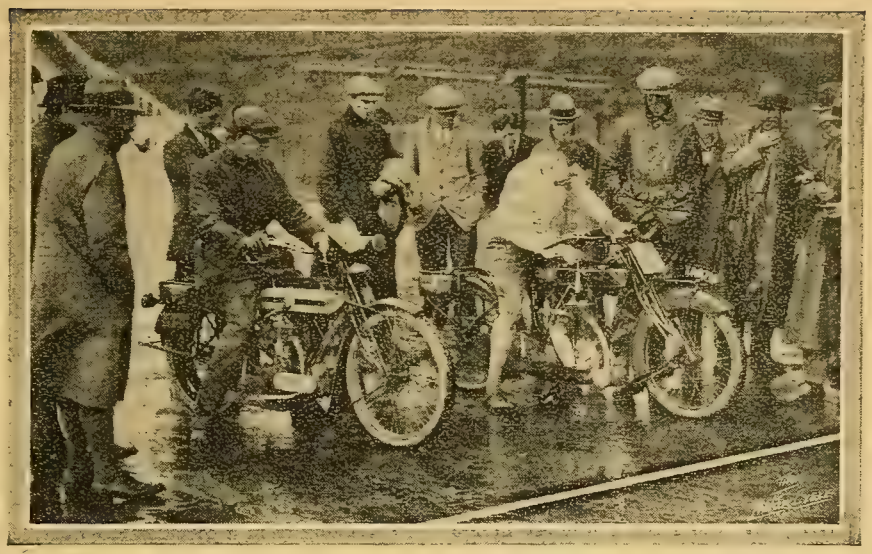
Paymaster Lt.-Cr. P. F. F. Bourne, R.N. (4 orton). Back brake broken; retired.

Lt. E. H. Mann, R.N. (2¾ Wooler). Failed on ost hills.

Lt. P. B. Lawder, R.N. (3 A.B.C.). Stop be-ween Titsey and Warlingham—jet or plug. Fell wing to being nearly run down by a car after nch.

Sub-Lt. C. R. Whitcroft, R.N. (6 Zenith). Punc-ure near Warlingham; failed Duke Hill; ran out f petrol near Warlingham; six attempts on Suc-ombe; lost way from Caterham to Redhill.

Sub-Lt. P. V. James, R.N. (3 A.B.C.). Lost ay; various troubles; retired.



The trophy winner and second man, on Sunbeam and Triumph machines respectively, starting their final lap at Brooklands.

Lt. G. P. Glen Kidston, R.N. (3½ Sunbeam). Failed through wheel slip on Salt Box Hill.

Lt. F. G. Emley, R.N. (4 Zenith). Broke belt; lost way; retired.

Lt. H. L. S. Baker, R.N. (4 Triumph). Stopped on all test hills; shed number plate.

Lt. W. E. V. Bashall, R.N. (3 A.B.C.). One stop; wheel slip on one hill.

Sub-Lt. K. B. Wilson, R.N. (2¾ Douglas). Side slip and twice ran out of petrol.

Sub-Lt. G. Plumer, R.N. (6 Zenith). Skidded Duke's Hill, made two attempts, and cut out hill; scarf caught in belt on main Guildford road.

Lt. T. H. Back, R.N. (4 Triumph). Legging caught in belt; two side slips.

Lt. C. J. M. Hamilton, R.N. (2½ Levis). Chain came off on Cudham Hill; stopped on several hills; choked jet on Cudham.

Lt. R. C. Hovenden, R.N. (8 Zenith). Owing to loss of crank case plug, dried up after Salt Box; sooted plug; retired Albury.

Second Day, 79½ Miles.—Hindhead to Brooklands via a Circuitous Course round Hindhead and by Byfleet to Weybridge.

The first item of interest on the second day was the hill near Bramshott which is steep, but with a good surface. It is quite a short distance from the start at Hindhead, but was an hour's run for the competitors. Near the start, R. V. Mack (Wooler) sheared his flywheel key and was delayed half an hour, so came straight on to Brooklands. The actual start took place in fine weather, but rain began as soon as the men left and continued to become worse and worse throughout the morning. The performances on this hill were much the same as on the others, and the only amusing incident was when Baker, who had to run as usual over the crest, stopped just as Mr. W. H. Wells, one of the stewards, was helping him along. "Where's the merchant with the blue car?" exclaimed Baker. "He's got my macintosh!" Considerable amusement was caused to the onlookers, as Mr. Wells was the owner of the blue Chandler, on which he had followed the trial.

Unfortunately, the arrowing again broke down—in fact, one arrow was reported to have blown down in the high wind, and after that every survivor lost his way.

The second man, Lt. T. H. Back, R.N. (4 Triumph). He was runner up in the 1919 trial.

Sub-Lt. K. B. Wilson, R.N (2¾ Douglas), on Pebblecombe He finished third

Sub-Lt. G. Plumer, R.N. (6 Zenith), near Hindhead, on the second day

An A.B.C. rider, Lt. P. B. Lawder, R.N., taking the corner at the top of Wray Lane.

Arbuthnot Trophy Trial.—

Two incidents occurred to men well in the running for the trophy. Kidston (Sunbeam) had a stop through water in the float chamber, and Bashall (A.B.C.) collided with two lorries near Guildford—exceedingly hard luck, as he was Kidston's only serious rival. Three competitors were involved, and one—Mack—escaped. Bashall was thrown off and escaped personal injury, but the back wheel of his motor bicycle was buckled.

On going through the competitors' cards, it was found that only Back and Kidston had a chance of winning the trophy. It was then decided that both should drive round the track at speed, and start at the paddock, turn sharp left at the straight, make two circuits of the track, stop at the finishing line, and ascend the test hill. The two survivors tossed as to who should start first. Kidston won, and got away well, timed by Mr. Ebblewhite. He made two fast circuits and a splendid ascent of the test hill. Back had all the luck against him. The track was swimming in water, and his belt slipped badly during the two laps, and on the test hill it refused to grip altogether.

The judges, Col. Davidson and Dr. Low, recommended that Back (4 Triumph) should be awarded a silver medal, and K. B. Wilson (2¾ Douglas) and E. H. Mann (2¾ Wooler) bronze medals. These awards were made notwithstanding that the competitors had had stops, and were given for meritorious performances.

The Second Day's Results in Brief.

Lt. G. P. Glen Kidston, R.N. (3½ Sunbeam), *winner of Trophy.* Water in float chamber; two stops altogether.

Lt. T. H. Back, R.N. (4 Triumph), *second, silver medal.* Engine stopped for unknown reason; three stops altogether.

Sub-Lt. K. B. Wilson, R.N. (2¾ Douglas), *bronze medal.* Stopped for petrol.

Lt. E. H. Mann, R.N. (2¾ Wooler), *bronze medal.* Failed on three hills, and various troubles.

Lt. R. V. Mack (2¾ Wooler). Retired; sheared flywheel key.

Paymaster Lt.-Cr. P. F. F. Bourne (4 Norton). Retired; brake came adrift.

Lt. P. B. Lawder, R.N. (3 A.B.C.). Lost exhaust valve rocker; retired Blackdown.

Sub-Lt. C. R. Whitcroft, R.N. (6 Zenith). Retired.

Sub-Lt. P. V. James (3 A.B.C.). Retired.

Sub-Lt. H. L. S. Baker, R.N. (3½ Triumph). Stopped on three hills; puncture.

Lt. W. E. V. Bashall, R.M.L.I. (3 A.B.C.). Retired owing to collision.

Sub-Lt. G. Plumer (6 Zenith). Retired.

Lt. C. J. M. Hamilton, R.N. (2½ Levis). Chain came off; choked jet; and footrests adrift.

Lt. R. C. Hovenden, R.N. (8 Zenith). Retired.

MYSTERIOUS NOISES.

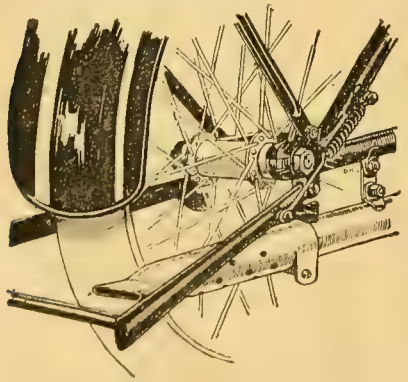
Little Details which Disturb the Meticulous Rider.

THE rider who has an interest in his mount notices every variation in its running and every strange noise which arises. To the sensitive soul any unfamiliar sound arising from the engine or transmission at once conjures up visions of some adjustment neglected, or some part complaining through lack of lubrication. Although these strange squeaks, groans, and janglings may occur from time to time even with the best and most sturdy 'buses it is seldom that the type of rider who heeds them is long puzzled by their origin.

Irritating Effects.

Sometimes, however, the punctilious motor cyclist senses an abnormal note in the chord of sound to which his ear is attuned.

Time goes on, and no obvious cause of the unfamiliar noise is apparent, examination reveals no derangement, and the rider is mystified. During a long day's run that which at the commencement was merely an inexplicable minor jangle, in the later stages becomes a pandemonium of cacaphonic din, and if the driver is unduly sensitive on these points and the cause remains undiscovered, his nerves (to use a good Americanism) get pulled to a frazzle. This is particularly the case with a normally silent machine, and such a happening recently occurred to a member of *The Motor Cycle* staff.



Spring operated rear stand, which is free to swing across the open end of exhaust pipe.

Returning from a considerable distance, over which the excellent pulling of the engine demonstrated its perfect order, he became aware of a minute jingling, the origin of which was no wise apparent. Nothing was loose, the transmission details were clear of the chain cases at every point, timing gear in order, mudguards, number plates, and accessories quite rigid. The jingle persisted. Baffled and exasperated, he eventually sought the assistance of a colleague.

The engine was started up, and every imaginable source of rattle investigated. For some time the second man listened in vain, not being able to distinguish the sound complained of, until, striding the saddle, and preparing to let in the clutch, a faint and rather musical note, alien to the usual mechanical sounds and not synchronous with the engine speed, assailed his ear. Looking down, he saw the glass disc in the tank filler cap slowly rotating under the influence of minute vibrations. A finger placed upon it damped its motion, and the mystery was solved.

On another machine, one of the few which may be termed really silent and which possesses no timing or transmission gears to create noise and confuse the issue, a rider was worried throughout a long journey by the fairly frequent recurrence of a high-pitched drone or squeak. For many miles the matter remained a provoking mystery, and mentally running over the possible causes brought no inspiration. The noise was independent of engine or road speed, and it was finally ascertained beyond doubt that its occurrence coincided with the moments of breasting a hill or running from amongst trees into open country. A slight head wind was blowing, and the dependence of the sound on variations of atmospheric pressure was becoming evident.

A Freak of the Wind.

It was noticed shortly afterwards that by slightly altering the position of the horn on the handle-bar the trouble disappeared.

The noise, apparently, had been merely the result of meeting the breeze, thus setting up vibrations which found resonance in the horn.

In the early part of the year the writer possessed a rather hot single-cylinder, the exhaust note of which was a joy to hear. It was his custom, of a still evening when the road was clear, to indulge in utterly illegal accelerations, what time cocking his ear aslant to catch the lovely "ponk-ponk" which burbled away at the rear.

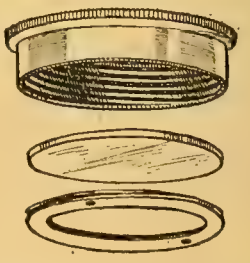
Ever and anon the even beat would be shattered by one or two ear-splitting notes in a higher key, and no cause could reasonably be ascribed to the occurrence. A road bump would *almost* always precede the noise, but not with sufficient invariability to form a definite clue.

A Helpful Skid.

Now this particular machine possessed a "spring-up" rear stand, which was operated by a rather too lively spring, and, in consequence, had a somewhat "up and down" time of it. One day, during a lurid mountaineering expedition, in company with some of the brighter sparks of our pet club, a fall was experienced which resulted in a few of the minor fittings being bent, including the stand, which now appeared to bind in its lugs, and, consequently, had its mad wagging somewhat checked.

This was all to the good, the *tout ensemble* of our appearance (*vide* passing reflections in the shop windows) was not marred by flappings at the rear. Incidentally, the mysterious exhaust note had disappeared. It had evidently been caused by the crossbar of the stand intermittently wagging across the end of the open exhaust pipe!

WHARFEDALE.



Component parts of filler cap; if the lock ring is not tight the glass will rattle.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

DUST RAISING.

Sir,—I hope "Hugh" is a very new rider. He does not appear to have much idea of road manners; but the fact of his asking for advice would seem to indicate that he may act on it when given. For his information and necessary action, therefore, I would say that, among decent people, any rider or driver who unnecessarily "smothers with dust" other riders, especially ladies, is considered a hog.

Two courses were open to him—*(a)* to stay behind out of the other rider's dust, or *(b)*, having passed them, to get ahead out of the way. As he states that he was out for "an easy comfortable ride" the former course would seem to be indicated. OLD 'UN.

Leeds.

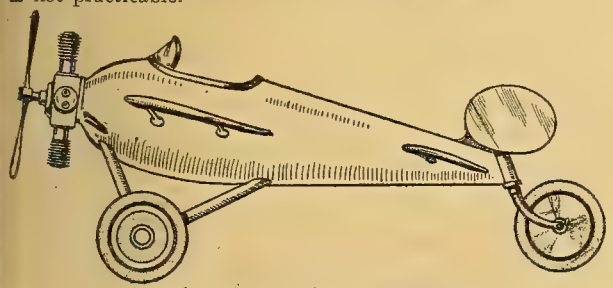
LACK OF POWER.

Sir,—I am the owner of a 4¼ h.p. machine, but since I have had it (four months) it has never developed its full power. Both tappets are apparently adjusted correctly, and there is nothing else that could possibly be the cause of the trouble. Still puzzled by the loss of power, I determined not to ride the machine until I had found the cause. I first dismantled the exhaust valve lifter arm, which is an outside arrangement, merely for the sake of more easily attacking the tappet. To my great astonishment, the tappet in question dropped nearly ⅛in., leaving an abnormal gap between the tappet head and valve toe. I saw immediately what the trouble was. The exhaust valve lifter arm, being too thick, held the tappet up, away from its cam and up to a correct clearance of the foot of the valve stem. From this it was obvious that the valve was not opening to its full extent, hence the loss of power. The remedy was to make the proper adjustment with lifter arm not in place, and file down the arm until it fitted perfectly. Since effecting this, the machine has developed its full power and greater revs. J.G.

PROPULSION BY AIR SCREW.

Sir,—I was greatly interested in the article recently published in your pages on propulsion of vehicles by air screws—either propellers or tractors—and it seems more than possible that useful developments should take place in this direction.

May I put forward the suggestion that the air-screw system be combined with "road wheel" drive, enabling the latter method to be brought into action in places where the former is not practicable.



A quaint idea from a reader.

To facilitate this, a petrol-electric system could be employed, and it would be possible to retain the fish-like streamline form of bodywork *à la* aeroplane, which would give such a vehicle a very smart aspect.

A further development, as shown in sketch, would be the fitting of clipped planes or wings, by using which it might be possible to take "long hops" over obstacles under favourable conditions. Some experimental work in this direction would certainly not be unfruitful. W. A. WOODWARD.

TYRE CREEPING.

Sir,—Leslie Eveleigh would, I think, cure most of his tyre trouble by pumping his tyres harder. Security bolts are "a thing of the past," and were always a source of trouble. Of course, he may be asking for trouble by starting with a jerk and by sudden and excessive braking, but an unduly stretched bead is something rare in these days, so far as my rather wide experience goes.

I never use levers to replace either my car or cycle covers after the first once or twice. OLD 'UN.

Leeds.

COMFORT.

Sir,—The letter of "Satisfied" is of interest and importance, as many of us are of opinion that too little attention is being paid by designers of machines to the matter of comfortable riding position, apart from the question of sprung or unsprung frames. Personally, I have used wide T.T. handle-bars and footrests on the many solo machines I have had during the past few years, and although I am approaching fifty, I can do a couple of hundred miles in the day without the slightest fatigue, and have no longing whatever for a spring frame for solo work. Now, with regard to sidecar work. I submit that the question of riding position is of still greater importance, because the spinal column receives heavier bumps and jars, which are transmitted from two directions instead of one, and it is, moreover, subjected to a twisting strain caused by the inevitable drag of the sidecar. This can be relieved to a great extent by the use of wide and fairly low handle-bars, footrests well under the rider, and the saddle adjusted to a level position, while the use of a hand-controlled clutch saves many an awkward strain on the back. By reason of the discomfort I have experienced, I have always disliked sidecar work, for I have found that it causes me more fatigue after 25 miles than I experience after 100 miles solo. In consequence, I have been looking forward for years to the ideal sidecar combination, properly sprung, and at the same time really comfortable to ride. My 1920 spring frame combination is ideal so far as the springing is concerned, and that is indeed a great deal to be thankful for in these bumpy days, but, on the other hand, the riding position is atrocious, causing a considerable set-off against the advantage of the springing. Footboards, which I detest, are fitted. It is impossible to get my feet well underneath me as a support; the saddle is a fixture, and must for ever remain with the peak tilted upwards at a ridiculous angle (throwing a fearful strain on the back), unless the peak is strapped down to the top tube; the handle-bar is narrow, and of the "beg and pray" position; and as to the foot clutch, I am not enough of an acrobat to be able ever to engage it with any degree of efficiency, although it only requires a touch to release it. Had I not known for a certainty that the machine had been designed by practical men, I should never have believed it. I therefore still await the ideal combination, and, in conclusion, I would like to lay stress on the fact that the weight of the majority of sidecar combinations continues to increase. ENTENTE.

TWENTY YEARS OF LIGHTWEIGHTS.

Sir,—I read with much pleasure "Veteran's" article on "Twenty Years of Lightweights," and was very glad to see a word of praise for the good little Clement-Garrard.

I owned one myself many years ago, and though now the proud possessor of a "big twin" often wish I had the old machine. With a few improvements in the way of carburetter, etc., I believe it would be quite capable of stretching out some of the modern baby two-strokes.

"Veteran" is a trifle pessimistic about the speeds. However, mine could do thirty-five easily on the level, and provided a good rush could be obtained, maintain thirty up a moderate hill. Of course, if baulked, or on a severe gradient, "slight pedal assistance" had to be applied.

The belt, however, was, as he states, a terrible affair. I have done fifty miles with only one breakage, but as a rule it either broke, or had to be tightened every ten miles or so.

I question whether for the single man, there was not better sport to be had then than now with the motor cycle. Certainly one could get better roads.

Birmingham. EMLAN.

CARBURATION.

Sir,—Much is being written just now about single lever carburetters, and it seems to me that the drift of modern practice is to provide an instrument for the novice, with which you can give him the information, "If you turn this lever that way the machine goes faster, and if the lever is turned the other way the machine goes slower." There are, however, some reasons to think that the single lever, while simple and foolproof, is a great and wasteful error.

This summer I have been riding a 1914 Triumph whose B. and B. throttle shutter controls most of the air, the separate air lever being more in the nature of a very small extra air intake. At speeds from 30 to 45 m.p.h. this carburetter was thoroughly efficient in power and consumption; but under considerable load it was difficult to accelerate from 15 to 25 m.p.h. Last January I found a 7-9 Indian carburetter to act in the same manner.

Theoretically, it seems that the above is just the behaviour that should be expected from any form of single-lever carburetter.

Even supposing the suction valve of the engine remains the same (which, of course, it may not do for long), there is still the enormous variation in suction due to variation of engine speed to which the carburetter has to adjust itself.

Taking a 4 h.p. engine, to develop its 4 h.p. a certain number of r.p.m. must be attained, and a certain throttle opening made. The makers will see that with these two conditions the air passages of a single-lever carburetter are such as to give the best mixture.

But suppose the full 4 h.p. (or as near as possible thereto) is wanted at a much less engine speed, the throttle is open wide, but the suction being so much less and the air open too wide, a weak mixture results, and one has to try the contradiction of closing the throttle in order to accelerate, which my Triumph actually did in these circumstances. At low engine speed, closing the throttle so as to get correct mixture, may preclude the possibility of attaining more road speed unless the load is reduced.

It would seem that with the single-lever carburetter it is necessary, if full horse-power is to be developed, to run the engine at the revolutions per minute to which the carburetter is tuned, for at no other engine speed will the mixture be right both as to quantity and quality.

In regard to the Triumph mentioned, I have fitted new shutters, made in an amateur fashion; but the point is that as they now work the throttle, opening or closing does not alter the amount of air intake. Similarly, by opening or closing the extra air intake shutter (which is now of considerable size) the throttle opening is not altered. Consequently, the throttle can be open wide, while the extra air is quite closed. The result is that at all engine speeds the balance between air and throttle can be found in a moment, and a weak or rich mixture obtained in the quantity required for the load at that time. The Triumph will now run fast or slowly.

I wonder how many of your other readers favour the single lever type, and whether there is some point in it which has escaped my notice, and which might account for the evident movement in favour of the single lever.

S. T. WILLIAMS.

TOLLS.

Sir,—I read with interest the letter of "A Business Driver" in your issue of July 1st *re* tolls. I recognise the two ninepenny tolls within two miles as being on the Portmadoc-Harlech road. One of these is on an embankment, on which runs the Festiniog railway, and the other on a bridge used by the Cambrian Railway. Both tolls are an imposition on the public in the interest of railway transport.

Another scandalous imposition on the public in North Wales are the gates on mountain roads and crown land erected by sheep farmers.

The local councils and police refuse to do anything about these gates, which have been in existence for many years. I have been in communication with the A.A. about them, who state that the matter is being enquired into, and that the Ministry of Transport can probably deal with them. I have also been in communication with the Ministry of Transport about the gates from the business standpoint of motor transport. The Ministry states that it has no control over these gates. The public have no obligation to shut these gates, and the owners have no redress for any damage to them.

Motorists touring through Wales will help the local people in their fight against the sheep barons by leaving open all these relics of feudal oppression.

ANOTHER BUSINESS DRIVER.

Festiniog, North Wales.

LIGHTWEIGHTS.

Sir,—As a regular reader of *The Motor Cycle*, I have been very interested from time to time in the discussions as to the merits, performances, etc., of two-stroke engines, and I think my own experiences may be of interest to your readers.

On being demobilised in January last I bought a second-hand Sparkbrook-Villiers engined 1915 model two-stroke of 2½ h.p., this being the only machine in the district available at the time.

Since then I have averaged 175 miles per week on businesss, wet and fine, and my carefully tested mileage is 57 m.p.g. on No. 1 Shell. I am rather a heavy hand at oiling, hence I try and decarbonise the engine once every eight weeks, but this small machine has never failed to take me wherever I wanted to go, and I have yet the hill to find which it will not mount on second gear. It is beautiful to handle in mud and grease, and starts at the first push without any exertion. The only fault I have to find is the way I am covered in mud, and I have tried wider mudguards, etc., to no effect.

The above mileage may seem very low, but I have carefully measured the petrol and read the distance by cyclometer, so I am sure of the figures.

My next machine will be a two-stroke of the same make, but with stronger spring forks, as I have smashed mine four times by running into pot-holes. A. C. M. LILLIE.

THE MACHINE FOR SPORT.

Sir,—I have been a most interested reader of your paper for the last ten years. My 'bus is a 3½ h.p. 1914 Singer, geared 4½ to 1, belt transmission, disc wheels, etc. I have no clutch, can touch fifty miles per hour, and throttle down to five miles per hour in traffic. The acceleration from this speed is all that can be desired. I live in Newport, Mon., where stiff hills are the order of the day; all these hills I can negotiate with ease, without any sign of overheating. Last summer I took an eight and a half stone passenger from Newport to London without dismounting on any hill. The only point which calls for constant attention is belt slip on an all-belt transmission; still with a minimum of care this can be practically overcome. Most people who condemn the sporting single do so because they pay too little heed to the tune of their engines. An out of tune T.T. single is a nightmare, but the super-tuned 'bus brings out all the hidden joys of driving, which, in my belief, are barred to users of geared machines.

Although it is nearly six years old, I would not part with my Singer; the engine is an example of first-class workmanship and material, all internal working parts are the originals bought with the machine, and to-day, after four seasons' use, show no trace of wear.

Lamentable is the day when Singers discontinued the manufacture of their famous motor cycles. I have no interests in the Singer Motor Co., only as an engineer I admire an engineering job.

Every success to your paper—instructive to the highest degree, and indispensable to every practical motor cyclist.

Newport, Mon. T.T. ENTHUSIAST.

SIDECAR LUGS.

Sir,—I trust you will allow me to use a little of your space to draw the attention of motor cycle manufacturers to the variation there appears to be in the *lugs* incorporated in the many machines for the attachment of sidecars. In many cases we find that the lugs so incorporated are badly designed, inasmuch as they are of small area and are totally inadequate to withstand the strains placed upon them by present-day road conditions. In some cases we have overcome the difficulty by using special high quality alloy steel for these weak attachment lugs, but there are still a number of machines with sidecar lugs incorporated for which we ourselves refuse to supply lugs owing to the danger of fracture.

On some machines which have come under our notice we find that the front attachment lug is simply a plain hole for a ½in. diameter spindle to pass through, with no radii on the front of the hole. It is quite obvious to all concerned how utterly impossible it is for a sidecar manufacturer to attempt to fit a sidecar with such attachments with any degree of safety.

I should like to suggest some form of standardisation of lugs which would facilitate more security and certainly less strain upon the motor cycle frame.

Production would be considerably cheapened, and any spares or replacements would be more readily obtained. I am prepared to spend considerable time and trouble in forming such standardisation for 1921 if I am given the necessary support. This is a matter which should have the attention and support of the trade in general.

It is obvious that hundreds of motor cyclists change machines every year, and in many instances prefer to keep to their old sidecar, but in every case they experience considerable trouble and expense in the change over. I am confident that with standard motor cycle lugs sidecars could be produced approximately £1 cheaper.

LEONARD B. HENDERSON, A.M.I.A.E.,
Managing Director, Henderson Sidecars.

REUNION OF EX-D.R.'S.

Sir,—With reference to recurring correspondence in your columns on the subject of reunions of ex-D.R.'s and the many attempts which have been made to arrange dinners and annual gatherings by different sections in different districts, I would like to point out that there has been in existence for yaars an "Old Comrades Association Royal Engineers" known as the R.E.O.C.A., with a "Signals" branch. Ex-service men will remember the placards advertising the association which were sent to divisional signal companies after the Armistice.

The annual subscription for rankers is 2s., whilst life membership only costs 30s. The secretary of the Signals branch is Mr. Edwin C. Honeywill, R.E.O.C.A. Signals Branch, 96, Shoe Lane, London, E.C.4.

The first annual dinner after the war was held in the Connaught Rooms in London last November, and will doubtless be held systematically in future. I myself undertook a 600 mile journey last year, hoping to meet lots of the old boys at the dinner, but was greatly disappointed. Amongst several hundred R.E.'s, from Major-Generals to Chelsea Pensioners, I was apparently the only ex-D.R. present.

I hold no brief for this association, but I draw attention to the ready-made meeting place for an ex-D.R.'s pukka feed and night out.

Now that "Signals" is to be a distinct and separate branch of the service, the attractions of the association are enhanced, for an annual dinner will in future be "Signals" only, for a separate association will be formed.

Under the above association length of service holds no sway, and the youngsters who joined as soon as they matured have the same standing as "old sweats" who were in it when it *was* a decent war, and the D.R. was a little tin god.

I would like to add that I shall be glad to hear from any who remember me with whom I am not in touch.

WILL B. DAVISON
(Ex-D.R. Sergeant of several outfits).

BOOKS AND MAPS FOR MOTOR CYCLISTS.

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS England and Wales, Scotland. London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

The Price of Petrol.

In America the price of petrol is less than one-third that charged in this country, yet there are grumblers.

'Ware Thieves!

Several readers complain that accessories have been stolen from their machines while in hotel yards.

A Misleading Slogan.

A firm has been advertising their product as the "machine for the engineer." May we suggest that their slogan, though quite neat, is very much open to misconstruction!

Point Duty.

Cannot some of our provincial police arrange lessons from their Metropolitan brethren in traffic control? The main streets of many of the smaller, but busy, cities and towns are at some hours of the day in a positive state of chaos; and control, if attempted at all, is often so inefficient as to constitute a further danger.

The Irish "Twenty-four" Awards.

The awards in connection with the twenty-four hours reliability trial of the Dublin Club to Donegal and back, on the 25th and 26th ult., are as under:

SPECIAL GOLD MEDALS.
(Full marks and clean ascents of Glengesh.)
J. Browne (2¾ Douglas).
E. B. Russell (5 Brough).
T. Woods (5-6 Martin-yde-Newman sc).
A Carton (3½ Sunbeam).
P. H. Hurse (4¾ B.S.A.).
H. McAllister (6 A.J.S. sc.).
S. G. Smith (4 Norton sc.).
P. A. Bell (5-6 James sc.).
C. S. Kettle (4¾ B.S.A.).
W. Wilhelm 8 Matchless sc.).
C. W. Johnstone (8 Harley-Davidson sc.).
T. E. Green (4 Blackburne).

GOLD MEDAL.
(Clean ascent of Glengesh; full marks at open controls and not more than ten marks lost otherwise.)
D Allen (4 Norton sc.).

SILVER MEDALS.
(Not losing more than twenty marks.)
J. Healy (5-6 James sc.).
R. H. Dodd (4 Norton sc.).
Major J. A. H. Waters (4 Norton sc.).
E. H. Bell (5-6 James sc.).

SIDECAR PRIZE.
S. G Smith (4 Norton sc.).

LIGHTWEIGHT PRIZE.
T Holland (Triumph Junior).

TEAM PRIZE.
Major J. A. H. Waters (4 Norton sc.).
S. G. Smith (4 Norton sc.).
D. Allen (4 Norton sc.).

The Utility Machine.

Recently, at a well-known car factory employing about 1,000 hands, more than thirty were observed motor cycling to work; and when it is considered that probably 20% of the remainder are also motor cyclists, the popularity of the sport in industrial centres is strikingly illustrated.

Risk of Multitudinous Summonses.

A motor cyclist last week, summoned at Woodstock, Oxon, for failure to produce his licence, said that he had been fined by another court on a similar summons relating to the same day. The Chairman of the Bench said, "If a man drives from Land's End to John-o'-Groat's he might be summoned 500 times. 100 policemen might stand in a row and each one could summon him." The Bench, however, dismissed the case.

Left-hand Drive.

The Ministry of Transport state that the Departmental Committee on the Regulation of Road Vehicles has been considering the question of the use in this country of mechanically propelled road vehicles with a left-hand drive.

Whilst no decision has yet been arrived at, the Committee are impressed by the rapid increase in the number of these vehicles, and the danger to the safety of all road users which is caused by them, and it is most probable that their use will be at least restricted at an early date.

Special Features.

THE SCOTTISH SIX DAYS TRIALS.
ARBUTHNOT TROPHY TRIAL.
NEW SIDECARS.

Aeroplane as Light as a Sidecar Outfit.

At the Aero Exhibition there is a 50 h.p. aeroplane which weighs but 4½ cwt.

Triumph sends Manager to U.S.A.

Mr. A. G. Franklin, the Triumph works manager left Liverpool last Monday on a business trip to the U.S.A.

Team Work.

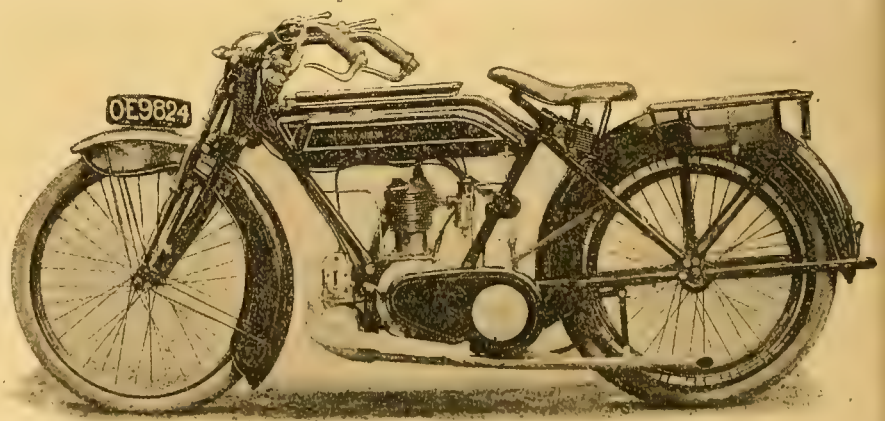
The Worcester M.C.C. are keen on team competitions. They had a strong team in the Scottish Trial, and have nominated another to represent them in the Irish End to End, when Eric Williams, J. Dudley and T. C. de la Hay will ride.

M.C. and A.C. Open Trial.

The open trial organised by the Midland Cycle and Athletic Club will be held on October 9th. There appears to have been a little friction between the A.C.U. and the Midland club over the date which was originally fixed for July 10th.

Taxation.

The Government appear to be firm on making motorists pay for the roads in their own particular day. The Motor Legislation Committee have pointed out that the same revenue can be obtained by a flat rate on petrol, but the Government seem to think "there is a catch in it somewhere."



A NEW HIGH GRADE LIGHTWEIGHT The Massey-Arran Jap-engined motor cycle—a well-designed and finished machine, embodying first-class equipment. It is made by Massey-Arran Motors, Ltd., Bellbarn Road, Birmingham

CLUB NEWS.

Hull M.C.C.

The first annual speed trials and races, organised by the above club, will be held at Holmpton Beach, near Withernsea, on Saturday.

N.M.C.F.U. (Leeds).

The results of the recent hill-climb, held on Leathley Bank, were as follow: 1st, A. C. Thornton; 2nd, R. Hortley; 3rd, W. Beaumont; and 4th, H. Patterson.

Loughborough and District M.C.C.

Recently this club held a reliability trial in the Peak District for the handsome £25 Trophy, given by Messrs. W. A. Bates, of Leicester. The route was a secret one, and proved very strenuous, including such climbs as Green Hill, Wirksworth, Gorsey Bank, and Riber Hill. There were thirty-five starters, and in spite of unfavourable weather, the event was thoroughly enjoyed, though many varied and candid opinions were expressed on the nature of the hills in Derbyshire, the gradients of many being severe.

Stalybridge and District M.C.

A reliability trial, over a strenuous 120 mile course, was recently held by the above club. Owing to the adverse weather conditions only fourteen competitors started, and of these the majority retired on the outward journey to Buxton. Two more dropped out on the return trip, leaving only three competitors to finish. The best performances on the hills were made by A. Wath (7-9 Excelsior), V. E. Lees (4 Triumph), and R. Hartley (3¾ Scott). The official results were as follow: President's Cup and gold medal: C. R. Norman (3½ James). Silver medals: V. E. Lees (4 Triumph), and R. Hartley (3¾ Scott).

West Fife M.C.

This club has recently been formed with headquarters in Dunfermline and an attractive programme is being arranged for the current year. The club is affiliated to the S.A.C.U. Particulars can be obtained from the joint honorary secretaries, T. D. Gordon Watt, Douglas Street, Dunfermline, and W. Joanes, Hospital Hill, Dunfermline.

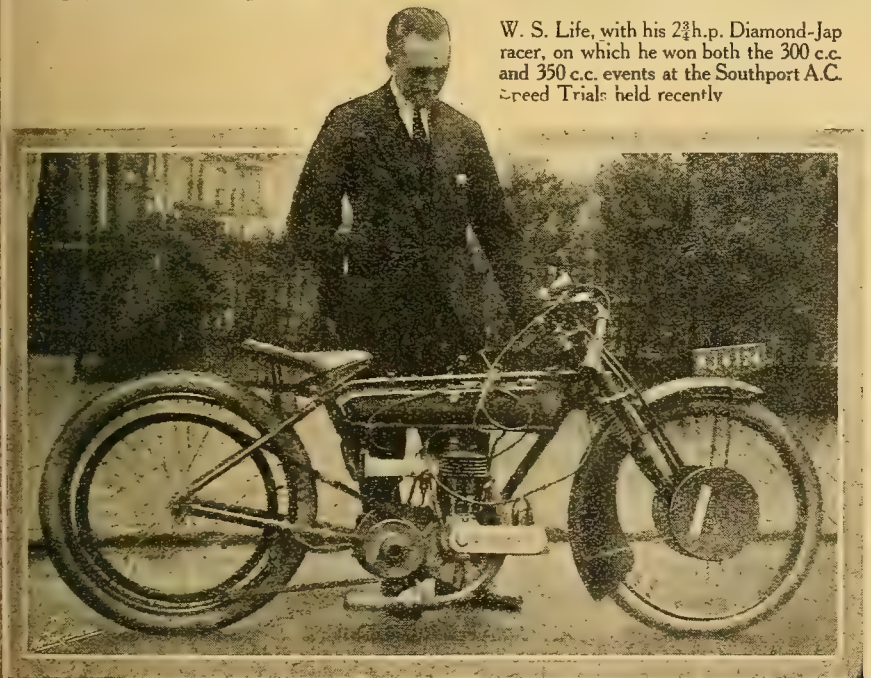
Helensburgh M.C.C.

The results of the speed-judging contest to Loch Lomond and back, recently held by this club, were as follow: 1st, A. McCulloch (3½ James), 1 min. 59 sec. error; 2nd, H. W. Ballardie (6 A.J.S. sc.), 2 min. 39 sec. error; 3rd, R. R. Campbell (10 Morgan), 7 min. 30 sec. error.

Harrogate and District M.C.C.

Owing to the most atrocious weather on the 4th inst. barely half the entrants faced the starter in the above club's reliability trial, which was run over a stiff course of about 160 miles, including four non-stop sections and four observed hills. The pick of the whole course was considered to be a short three-mile run from Summerbridge to the top of Wilsill Raikes, and only G. A. Reed (3¾ Scott) managed to check in to time—in fact this rider easily made the best performance, and if he had not stopped to help three other competitors who had fallen together he would no doubt have had a clean sheet. The only sidecar to finish was a 4¼ B.S.A., driven by H. E. Ellis.

Only five riders checked in to time at the finish, the provisional results being as follow: Winner, G. A. Reed (3¾ Scott). Runners up, H. E. Ellis (4¼ B.S.A. sc.), C. Michell (4 Triumph), E. Wasling (3¾ Scott), and W. Atkinson (4 Triumph).



W. S. Life, with his 2¾h.p. Diamond-Jap racer, on which he won both the 300 c.c. and 350 c.c. events at the Southport A.C. Speed Trials held recently

N.M.C.F.U. (London).

A meet has been arranged with the Midland and North-country branches for a run to Oxford on Saturday. Meeting place, Bald Faced Stag, Edgware, at 12.30 p.m., and the party will leave at 1 p.m. sharp.

Manchester M.C.

It was the intention of the above club to have held a speed trial at Bill o'Jacks, Greenfield, on Sunday, July 4th. However, owing to the bad road surface and weather conditions, this had to be postponed. It has now been decided by the committee to hold a hill-climb at Boothdene Hill on Sunday, July 18th, for which the entries of the postponed speed trial will stand.

The climb will be held on the Ripponden side of the hill. The best way from Manchester is *via* Oldham, proceeding along Ripponden Road to the bridge at the foot of the hill five miles out of Oldham. The road surface on the part of the hill that the climb will actually take place is in first-class condition.

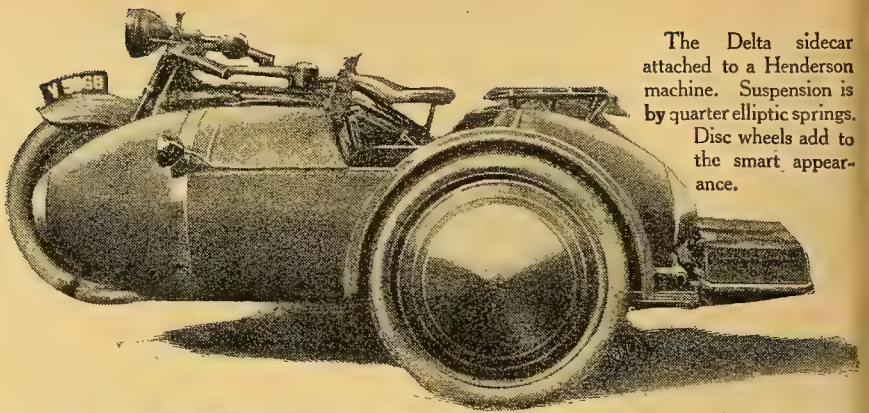
Week-end Club Events.

July 17.—Sutton Coldfield and N. Birmingham A.C. Hill-climb.
July 17.—Newcastle and District M.C. Hill-climb
July 17.—York and District M.C. Consumption Trial.
July 17.—N.M.C.F.U. (Wolverhampton). Captain's Day.
July 17.—Ilkley M.C. and L.C.C. Cumberland County M.C.C. Trial.
July 17.—Eastern Valley M.C.C. Run to Wye Valley.
July 17.—Woolwich, Plumstead and District M.C. Team Trial.
July 17.—Edinburgh and District M.C. Lanark Meeting.
JULY 17.—CUMBERLAND COUNTY M.C.C. OPEN TRIAL.
July 17.—Coventry and Warwickshire M.C. Picnic.
July 17.—N. Wilts M.C. and L.C.C. Run to Oxford.
July 17.—Sheffield and Hallamshire M.C.C. Gymkhana.
July 17.—Wolverhampton M.C.C. Rudge Cup Trial.
July 17.—North Lindsey A.C. Reliability Trial.
July 17.—Bury and District M.C. Gymkhana.
July 17.—Dewsbury and District M.C.C. Paperchase.
July 17.—Lancaster, Morecambe and District M.C.C. Secret Check Run.
July 17.—Bridgwater and District M.C. and L.C. Reliability Trial.
July 17.—Liverpool M.C. Amateur Club Trial.
July 17.—Hull M.C.C. Annual Speed Trials.
July 18.—Rochester, Chatham and District M.C. Run to N. Forcland.
July 18.—Hull M.C.C. Run to Bridlington.
July 18.—Basingstoke M.C.C. Run to Savernake Forest.
July 18.—Dewsbury and District M.C.C. Run to Knaresborough.
July 18.—North London M.C.C. Surprise Run.
July 18.—Canterbury and District M.C.C. Consumption Trial.
July 18.—Essex M.C. Speed-judging Competition
July 18.—Harrogate and District M.C.C. Competition.
July 18.—Stalybridge and District M.C. Wakes Week.
July 18.—N.M.C.F.U. (Leeds). Reliability Trial.
July 18.—Reading and District M.C. and L.C.C Run to Brighton.
July 18.—Exeter M.C. and J.C.C. Run to Lydford and Gorge.
July 18.—Northern M.C. Run to Leg Cross
July 18.—N.M.C.F.U. (Portsmouth). Run to Goodwood.
July 18.—Westmorland M.C.C. Social Run.
July 18.—N. Wilts M.C. and L.C.C. Picnic.
July 19.—Lancaster, Morecambe and District M.C.C. Parade.
July 20.—Lancaster, Morecambe and District M.C.C. Captain's Run.
July 21.—Rochester, Chatham and District M.C. Run to Tunbridge Wells.
July 21.—Loughborough and District M.C.C. Run to Breedon-on-Hill.
July 22.—Hull M.C.C. Run to Howden.
JULY 24.—LUTON AND S. BEDS A.C. OPEN SPEED TRIALS.

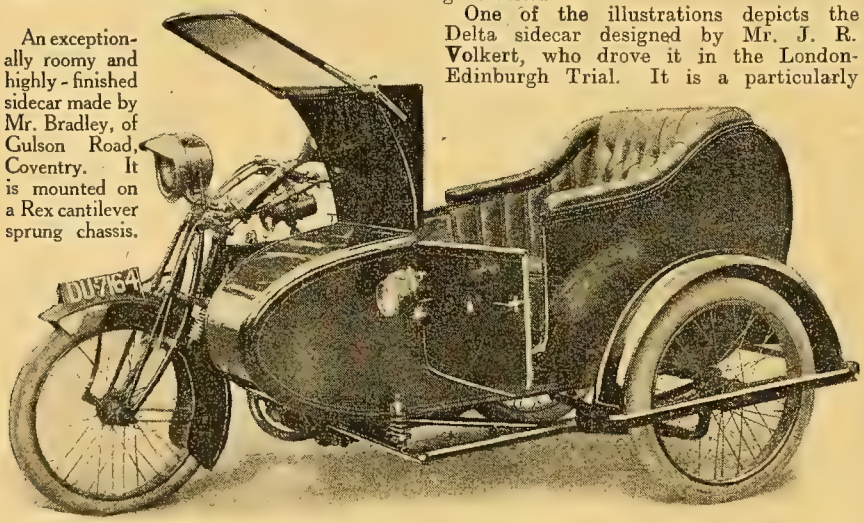
MODERN SIDECAR DESIGN.

Some of the Latest Specimens of Coach-built Bodies.

A PROMINENT American manufacturer recently told us that he thought the British motor cyclist had too many sidecar types from which to choose. By this he meant that so long as every one of the dozens of manufacturers produced different types it cannot be expected that prices will be so low as they are in America. In the U.S.A. only a few firms specialise in sidecar construction, and then no attempt is made to produce the de luxe type of vehicle now turned out by the British industry.



The Delta sidecar attached to a Henderson machine. Suspension is by quarter elliptic springs. Disc wheels add to the smart appearance.



An exceptionally roomy and highly-finished sidecar made by Mr. Bradley, of Gulson Road, Coventry. It is mounted on a Rex cantilever sprung chassis.

Apparently the viewpoints of British and American buyers are totally different, for we cannot imagine British owners of de luxe motor cycles fitting the "tin-shell" types of sidecars which are in favour in the U.S.A.

On this and the following page we are able to give illustrations of some of the latest British designs and an American, which will shortly be offered to the British public. The eight designs shown well illustrate modern tendencies, and if there is a suggestion of over-elaboration in some cases, one must remember that they represent more or less what the motor cyclist requires. There is a great deal in pride of possession, and the owner of a really first-class outfit de luxe is at the top of his class, whereas with a small "cheap" car he is at the bottom of another.

From our own experience of sidecarring, we agree that anything which can be provided for the comfort of the passenger should be added. The sidecar machine is the most economical means of transportation for two or three persons; but there is no reason why a little luxury should not be added in the way of high and deep upholstering.

At the present time, however, most sidecars are comfortable — even the apparently uncomfortable sporting machines now so popular with the younger generation.

One of the illustrations depicts the Delta sidecar designed by Mr. J. R. Volkert, who drove it in the London-Edinburgh Trial. It is a particularly striking machine of the "torpedo" type, and is sprung in rather a novel manner, flat quarter-elliptic springs being fixed at the rear end of the chassis.

Another sidecar illustrated is the "B.J.," marketed by W. H. Jenks, of 63, Snow Hill, Birmingham. Its chief novelty lies in the means by which the front of the body is hinged to serve as a door. Two types are made, a sporting and a touring model. The prices of the bodies alone are £10 and £13 10s. respectively, and they are constructed of sheet metal, finished in an attractive shade of purple.

Another unusual design is shown on the following page. It is known as the Lacelles, and is the product of Mr. P. V. W. Fenn, 19, Westfield Road, Surbiton, Surrey.

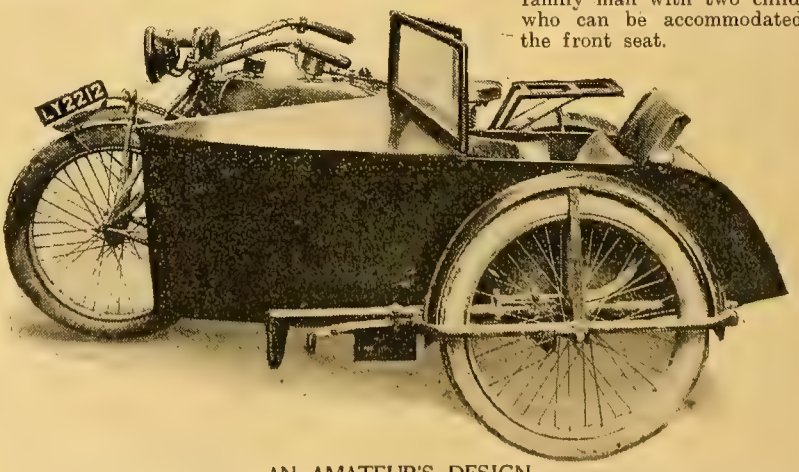
The seats much resemble the cock-pit of an aeroplane, access being obtained by lifting the aluminium covers, which are hinged at the front in the forward seat and at the rear in the back seat. When the passengers are seated, the covers are drawn up and held in position by two spring clips located on the inside.

Hoods will be fitted to each seat, and, in order to retain the streamline appearance, they will be constructed as small as possible.

Arm rests are provided which, with the seats and backrests, are well-upholstered in leather. Located in the bulbous back is a locker of generous size which accommodates spare fuel and luggage.

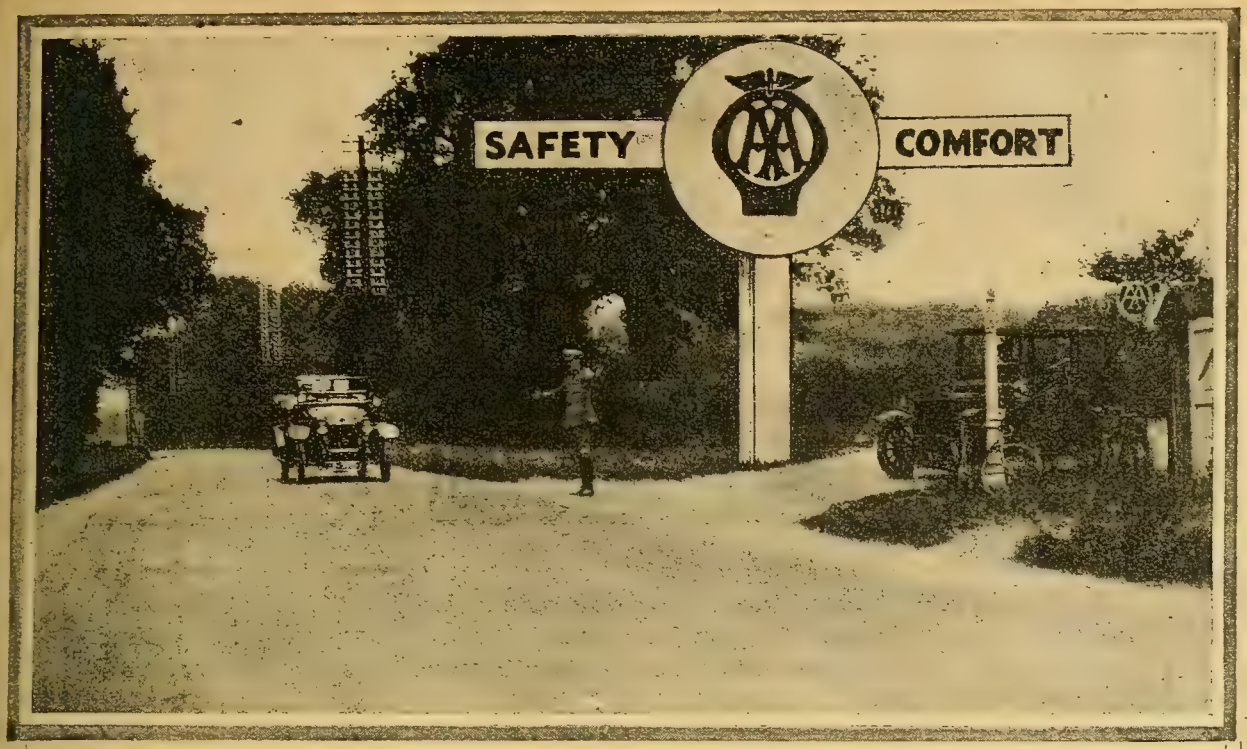
Mr. Fenn is anxious to dispose of his patent rights.

A tandem-seated body is also shown—a Venus model. It is intended for the family man with two children, who can be accommodated in the front seat.



AN AMATEUR'S DESIGN.

A sidecar of distinctive appearance, designed by Dr. Morris, of Hereford, rather suggesting a racing boat in appearance. It is very light, and is fitted with a comfortable hammock seat. The top of the body is hinged at the front, and can be raised to allow easy access



"Next Monday Fortnight."

Motoring Comfort at Holiday Time.

When the rest of the world takes a holiday, the public services are subjected to a spell of overwork. Just as the railways experience a rush of passenger traffic at Bank Holiday times, so the Automobile Association copes with a similar rush of road traffic and a large addition to its membership, which now stands at over 135,000.

The number of members joining the Association during a week previous to a general holiday is gradually increasing as is shown by the following figures:—August Bank Holiday, 1919 - 2,151
Easter Monday, 1920 - - 2,194
Whit Monday, 1920 - - - 2,666
an average of over 2,370 new members a week

On the road the A.A. patrols and the qualified mechanics in charge of the "Mechanical First-Aid" Machines will be busy from morning to night directing members on their way, and rendering practical mechanical assistance when necessary.

On an average during holiday week-ends, 500 cases of temporary derangement and 60 cases of mechanical breakdown are attended to, and members are enabled to continue their journeys, congratulating themselves on their foresight in joining the Association.

After a holiday the Legal Department of the A.A. receives increased applications from members for Free Legal Defence in respect of summonses under the Motor Car Act and Regulations. The value of this benefit to a motorist who may unwittingly commit a technical offence two hundred miles from home is apparent. There is no need for him to appear in court at the other end of the Kingdom, or allow the case to go undefended. He places the conduct of the summons in the hands of the Association, and the case is defended entirely free of cost to him. In forty-nine cases heard during one week, the Association secured the dismissal of twenty.

Other practical A.A. benefits which are provided to members include Home and Foreign Touring facilities, roadside telephones with a day and night service, roadside motor fuel supply stations, officially appointed hotels, also agents and repairers, a special insurance policy, engineering advice, etc., etc.

Full particulars of all these benefits are given in the new illustrated booklet: "The Key to the Open Road" which can be obtained post free from the Secretary, The Automobile Association, 21, Fanum House, Whitcomb Street, London, W.C.2. Send a postcard to-day, the booklet will be sent by return of post, and in a few days you can motor with comfort under the protection of the A.A. badge.

A SUPER TRIUMPH FOR BRITISH MANUFACTURE

The hardest road race in the world; 400 miles; this year's race in SOUTH AFRICA was run under appalling conditions; 42 started; 5 finished; first and second places were occupied by British machines, the 3½ h.p. and 2¾ h.p. "DOUGLAS."

AS a feat of endurance for both riders and machines there is probably nothing to equal this year's race in SOUTH AFRICA. The T.T. race in the I.O.M. is as a "run in a park" compared with it.

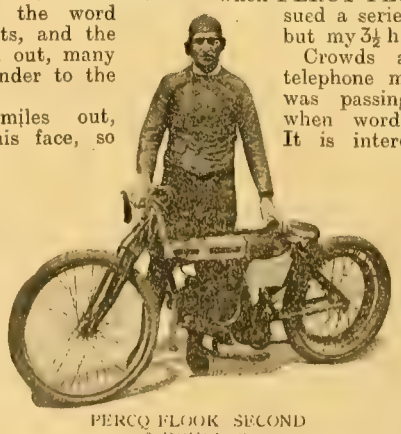
In good weather the route is but an ordinary earth road for most of the way; sprinkle over it a half inch of rain, and such roads can run like rivers. To run a race—a race, mind you, not a reliability trial—over this course in the winter, is always an adventurous proceeding, but when the winter is in its worst mood, motor cycle racing on this route can be little else but a frightful nightmare.

An idea of the conditions may be guessed from a comparison of the winner's time this year with that of last year's winner. In 1919, Mr. PERCY FLOOK, on a 2¾ h.p. "DOUGLAS," covered the first part of the course, approximately half way, NEWCASTLE, in 5 hours 5 mins., but this year, Mr. F. A. R. ZURCHER, on a 3½ h.p. "DOUGLAS," took 13 hours, 1 min. to cover the same distance.

Probably no motor cycle race ever started under such conditions; snow, rain, wind, rivers of mud, that are called roads when dry, and a temperature which froze up lubricators and carburetters—such were some of the difficulties besetting the competitors who started from the CITY DEEP on SATURDAY, MAY 29th, last. From the word "to go" it was a battle with the elements, and the ranks of the competitors were soon thinned out, many old hands and well tried machines going under to the forces of nature.

Fast going was impossible. Six miles out, ZURCHER got gravel thrown up into his face, so badly that he had to stop to bathe his eyes in a stream, and it was some time before he could see well enough to ride. "The mud was indescribable," he says, "one would ride and simply slither down and get up and try again." At STANDERTON the positions of the riders were the same as at the start, ZURCHER being No. 15, but at VOLKSRUST he had gained a few places, being eleventh to pass this point. From here to LAING'S NEK the roads were well nigh impassable. On SATURDAY EVENING, after ploughing their way through perfect seas of mud, till every nerve in their half-frozen, rain-soaked bodies ached, three utterly bedraggled riders found they had reached MOUNT PROSPECT, and concluding that they were the only ones left in the running, they decided to rest for the night. Meantime, ZURCHER, on his "DOUGLAS," tore his way through and passed on to NEWCASTLE. The other three followed as quickly as conditions would permit, and at NEWCASTLE, ZURCHER arrived first, fifty-five minutes after midnight. P. FLOOK, on the smaller "DOUGLAS," followed at 2.11 on SUNDAY MORNING, and F. OWEN, on an INDIAN SCOUT, at 3.30 a.m. FIVE others on JARLEYS, INDIANS, and A.B.C.'s rolled in at varying times up till 11 a.m.

At this first stage of the journey, there were only EIGHT survivors. ZURCHER left again at 7 a.m., and the others followed at intervals. Local riders, who had gone out to give assistance had been left behind in the mud, and it was many hours before they returned, each one having had to dispense with his mudguards in order to get back. From NEWCASTLE to the finish, the roads were considerably improved, the winner says "for the first I got away on hard road, and had a reasonable ride until a puncture stopped me. I had completed repairs, and was about to start, when PERCY FLOOK came up within forty yards. Then ensued a series of long stiff climbs with a bitter head wind, but my 3½ h.p. enabled me to keep ahead of FLOOK."



PERCY FLOOK SECOND
2¾ DOUGLAS

Crowds assembled at MARITZBURG, when a telephone message came through that the first man was passing HOWICK, and excitement increased when word came that FLOOK was close behind. It is interesting to quote from the local paper description at this point: "As one o'clock struck, a wisp of dust was seen at the corner beyond the bridge, and a motor cyclist came into view tearing down the foot of the hill, hatless, clad in the leather garb of the racing man, bending low over his machine. The waiting throng opened and then closed around him, as in an anxious voice he shouted for petrol; the tank gulped its fill, the mouth shut with a click, the crowd opened again, and the first man, F. A. R. ZURCHER, on his new model "DOUGLAS," of 3½ h.p., took the road with an easy gait on the final lap to the Port."

In answering this advertisement it is desirable to mention "The Motor Cycle."

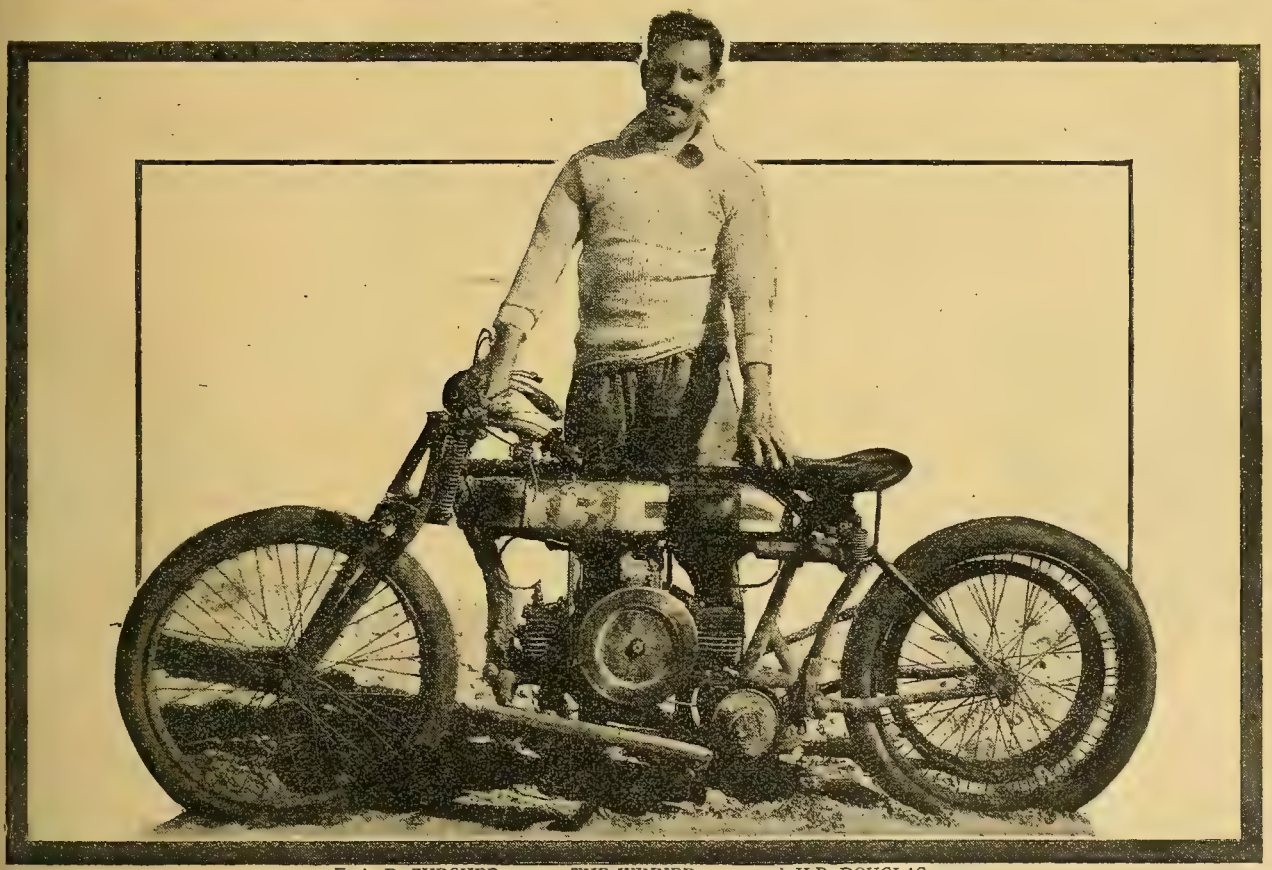
Mr. ZURCHER was the first competitor to dash into the crowd which constituted the finishing post at the Toll Gate in DURBAN. He arrived at 29 mins. past 2, and was loudly cheered. Beyond a broken footboard and a thick coating of dust and mud, his machine was in excellent order, and he himself did not seem unduly distressed.

PERCY FLOOK, who won last year's race on the same machine as he was now riding, was the second man to arrive, being timed in at eight minutes past three. He bore signs of a gruelling ride, and was almost exhausted. He had the misfortune to break his handlebars, but undeterred, he had rigged up a wooden device, and it is safe to say that no ordinary man would have ridden his machine for many yards in its then condition.

As an instance of the difficulties which they had to face, may be mentioned that Mr. ZURCHER started wearing a heavy pair of brogues, but before he reached NEWCASTLE, the left one was completely gone, whilst the other was worn through to the sock. A friend supplied a pair of sand shoes, and he wore these for the rest of the way.

The other riders who finished were F. OWEN (Indian Scout), MURRAY (Harley), and T. NICHOL (A.B.C.), all of whom arrived many hours after the first two, the last-named being right out of time (some eleven hours later) for medals. Mr. ZURCHER wins the SCHLESINGER VASE and £100 cash prize, also the ADLER CUP and cash prize £10 for fastest time in handicap, with Club Gold Medal added. Mr. FLOOK wins a Club Gold Medal and cash prize £40.

The machine which had fought its way through such a remarkable adventure is the 3½ h.p. SPRING FRAME "DOUGLAS," which is intended for the 1921 market. It was a standard machine, stripped for the race, and it is interesting to note that it is the first one to reach the Colonies, it having arrived only two weeks before the race. It speaks volumes for Mr. ZURCHER that he was able to take on a strange machine and ride to victory with so little preparation. It has scored the greatest success ever attained by any machine in competition in SOUTH AFRICA, and one cannot help feeling a sense of pride in the fact that a British machine was able to win where the field is usually scooped by foreign machines of much greater power, and it is interesting to note that a number of these machines did not start, their riders deeming it impossible to get through under such conditions. It is expected that the result will have the effect of turning public favour in the Colony to the medium power mount, which has demonstrated emphatically that it can do all and more than the "unlimited class."



F. A. R. ZURCHER. THE WINNER. 3½ H.P. DOUGLAS.

To quote the winner:—

"The 3½ h.p. 'DOUGLAS' behaved magnificently; it ploughed through mud, it swam through water, and when dry roads were eventually reached, 200 miles from the starting point, it showed a turn of speed and capacity for hill-climbing almost beyond belief, and the advantages of the SPRING FRAME cannot be over estimated."

DOUGLAS MOTORS, LTD.,
Kingswood - - Bristol.

In answering this advertisement it is desirable to mention "The Motor Cycle." B15

BRITAIN'S REPLY to American Tyre Invasion

As a proof of our confidence in the quality of our new 1920 type Skew Motor Cycle and Light Car Tyres, we make the following offer (open for a few weeks only):

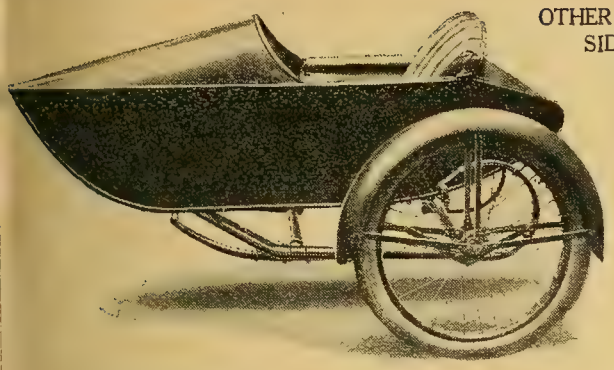
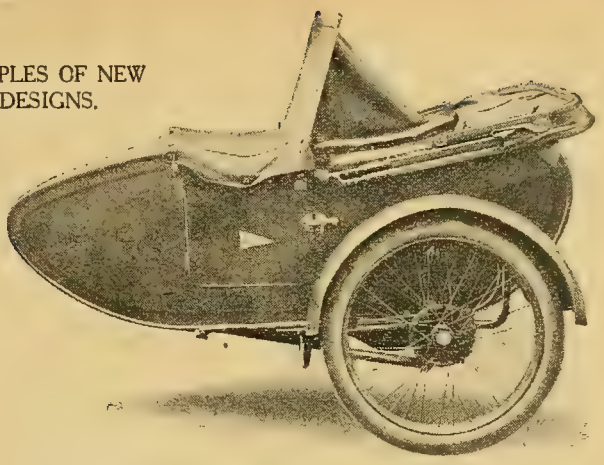
Modern Sidecar Design.—

OTHER EXAMPLES OF NEW SIDECAR DESIGNS.



Another example of a boat sidecar, the National, an American product, which is to be offered in this country.

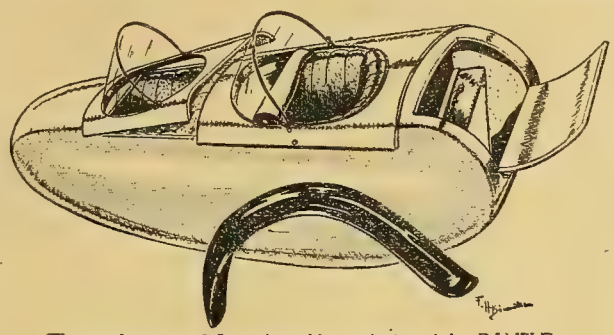


A smart and roomy Venus sidecar, made especially for attachment to Harley-Davidson machine.

Dr. Morris, of Hereford, is responsible for the boat like sidecar shown at the foot of the preceding page, and it has many novel features which are the outcome of experience on the road. For example a tool rack is embodied in the inner side panel and is covered with a leather flap.

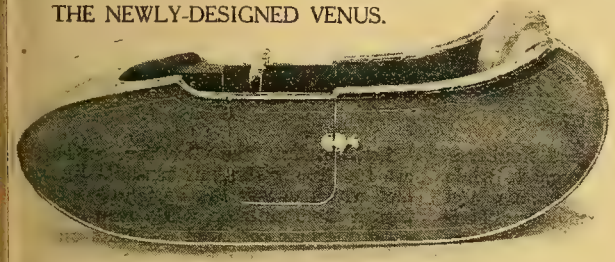
The Venus "Harley" model is another fine sidecar, embodying a spring wheel, while the American example illustrated — the National, which is to be marketed by Messrs. Shillan, Beck and Co., 30, Cannon Street, E.C., strikes a new note in sidecars in this country. It is comparatively light and simple in construction, and no doubt will appeal to many owners of medium powered machines.

So far few firms have considered the possibilities of the dickey seat for the accommodation of a juvenile of ten to twelve years of age. The Rex Co., however, has been very successful in this direction, and has produced for a member of *The Motor Cycle* staff, a sidecar with a folding rear seat, which has proved in every way a satisfactory solution of the problem confronting the family man who owns a motor cycle.

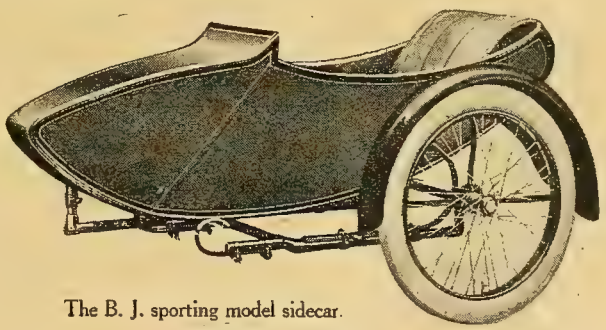


The tandem-seated Lascelles sidecar, designed by P.V.W.Fenn referred to on the preceding page. Observe the neat screens.

THE NEWLY-DESIGNED VENUS.



This Venus No. 12 Model is a three-seater, designed to fulfil the requirements of the family man. The bulbous back incorporates a large locker, capable of carrying a petrol can.



The B. J. sporting model sidecar.

A 2,880 MILES NON-STOP ENGINE TEST PROPOSED.

SOMETHING new in trials is suggested by Mr. E. C. Paskell, of the Colmore Depot, Birmingham, who considers that the ordinary rider is more interested in the reliability of standard machines than in the performance of those unusual or freakish designs produced to compete in special events. In order to provide an opportunity of demonstrating the reliability of standard machines a special form of trial does appear to be necessary.

"It is very surprising," he writes, 'that such a difference of opinion exists as to how long any machine would run under ordinary riding conditions. I, therefore, intend to promote a competition, to be called the 'Colmore Reliability Trial.'

"ENTRIES.—Any machine as supplied to the public.

"COURSE.—Twenty miles, including ascent and descent of good hill.

"TIMEKEEPING.—Every machine must pass the starting point every hour, not more than ten minutes early or ten minutes late.

"RIDERS.—Machines can be ridden by any rider. Change of rider to be made at the starting point

"RUNNING.—Engine must be kept running continuously.

"ADJUSTMENTS AND REPAIRS.—May be made if engine is kept running.

"LIMIT OF TRIAL.—A time to be fixed for the event to finish (if the event ran for six days, 2,880 miles would be covered).

"Sunday riding to be avoided if event carried on over six days.

"The passenger to be chosen, or approved, by the committee.

"PRIZE.—Colmore Depot will give a prize of £100 to the winner (to be divided if more than one). Doubtless this prize will be augmented by others.

"RULES.—To be made by small committee.

"A trial on the above rules will provide a good test, especially for lamps, plugs, magneto and general construction of machine, and I hope that it may be possible to get the support of the Manufacturers' Union and the leading motor cycle clubs.

"I shall be pleased to receive advice or criticism from any one interested."

H. R. Davies (6 A.J.S. sc.) on the Spittal of Glenshee, a gradient which would be considered formidable in an English trial, but regarded as unworthy of being an observed hill in the Scottish Six Days.

Detail Report of Each Day's Run by Members of "The Motor Cycle" Staff accompanying the Competitors.

THE FIRST DAY.

Observed Hills—Amulree, Cockbridge Ladder, and Bridge of Brown.

INVERNESS, MONDAY.

GOOD organisation was responsible for a wonderful lack of incident at the start of the trial from Perth. A few drops of rain fell, but the clouds were high, and throughout the day fine but dull weather was experienced, with a few really bright intervals.

An easy road led to Amulree, and though undoubtedly long and tricky, the chief trouble experienced on this hill was due to the terrors that its reputation inspires, and the fact that it occurs before competitors have settled down to the regular hard work of the Scottish Six Days.

The hill was in good order, though the loose flints near the top were trying and caused a certain amount of anxiety.

As recorded in last week's issue, considerable variation in driving skill was seen on Amulree, most of the expert riders taking the second bend widely. C. P. Wood (Scott) made the best ascent, the steadiest climb was credited to Cumming (Sunbeam), and Bischoff (2½ Clyno) made the best performance on a lightweight.

P. and M., B.S.A., Scott, and Sunbeam machines were exceptionally good, while among the sidecars the Matchless and A.J.S. stood out conspicuously. Moir (Harley-Davidson) was good, but Dawson, on a similar machine, failed, as did R. G. Mundy (Reading Standard sc.).

The Richardson cycle car also failed, and both the two single-geared riders, McGregor (Brough) and Carfrae (4 Triumph), found the hill too much for them. The latter rider fell on the lower part of the hill.

At the top of the hill was the first check.

10 m.p.h. Limits.

The descent of Kenmore gave newcomers to the trial an idea of what was to come on the fifth day, and, incidentally, an opportunity of studying the better side of the road.

From Pitlochry a moorland road was traversed, and here A. B. Fairley (2¾ Douglas) broke a throttle wire. After a hurried repair he pushed on, only to hit a bridge and damage his forks a mile or two further on.

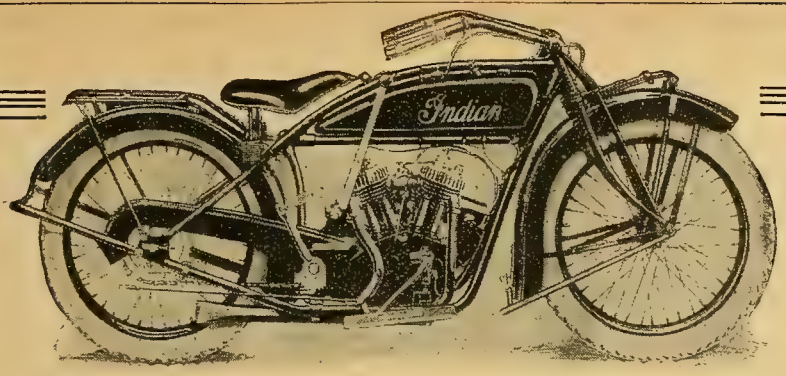
The second check was just beyond Kirkmichael, and thence a narrow road with a long 10 m.p.h. limit led over open moors.

Incidentally, the Scottish authorities are too free with their ten-mile limits—a fact which causes the unrighteous to disregard them entirely, while even the more careful riders get tired of limits on wide roads with no turnings.

Glenshee was the next point of interest, and the long pull up after the Spittal Hotel was rough and twisty. Here H. Gibson (2½ Clyno) got into a rut and fell while fiddling with an air tap. Fortunately, he was unhurt, and made a fine climb of the Devil's Elbow. Both the corners of this "double twist" have been laid with concrete on the inside, and, in spite of the steep gradient, many preferred to take the smooth surface to the rough but easier outside curve. The Devil's Elbow is too easy a test to cause much trouble to multi-geared mounts, and R. Carfrae made a fine climb on his single-geared Triumph.

The descent to Braemar was rutty at the top and required careful driving, but later the road improved, and it was possible to enjoy the wonderful scenery and to note with interest that snow still lay on the mountain heights.

After an excellent lunch at Braemar the main road was followed to a point just opposite Balmoral Castle, where a sharp left turn led up a narrow lane. Then



PROVING THE RELIABILITY

of the

Indian SCOUTS

BEFORE SUPPLYING THE PUBLIC.

Up to the present INDIAN SCOUTS have entered in three long distance Reliability Trials, and in every instance (as shown below) they made a 100 % performance.

December 26th, 1919: **London-Exeter-London Trial.**
One INDIAN SCOUT entered and secured Gold Medal.

April 3rd, 1920: **London-Land's End Trial.**
Three INDIAN SCOUTS entered and secured Gold Medals.

May 21st-22nd: **London - Edinburgh Trial.**
Four INDIAN SCOUTS entered and secured Gold Medals.

June 17th: **TOURIST TROPHY RACE.**
The three INDIAN SCOUTS nominated for the INDIAN team all finished in the first twelve with no mechanical troubles whatever.

After these conclusive tests of reliability, we have no hesitation in offering the INDIAN SCOUT to the public as an ideal solo touring machine

DELIVERIES will commence in July.

Present price of INDIAN SCOUT Model as described in current catalogue **£140** EX LONDON WORKS.

HENDEE MANUFACTURING CO.,
"Indian House." 366-368, Euston Road, London, N.W.
Telephone: Museum 1648. Telegrams: "Hendian, Eusroad, London."

The Seal of Perfection

On a modern motor bicycle is the gear which carried the despatch-riders through the war, and will carry everyone who values a good and properly equipped machine through the joy-rides of peace. The Sturmey-Archer is no experiment. It has been proved through the greatest of ordeals, when life was the penalty for failure. Specify a Sturmey-Archer if you would have perfect motor cycling.

Sold by all good agents, and fitted to all good motor bicycles.

STURMEY ARCHER

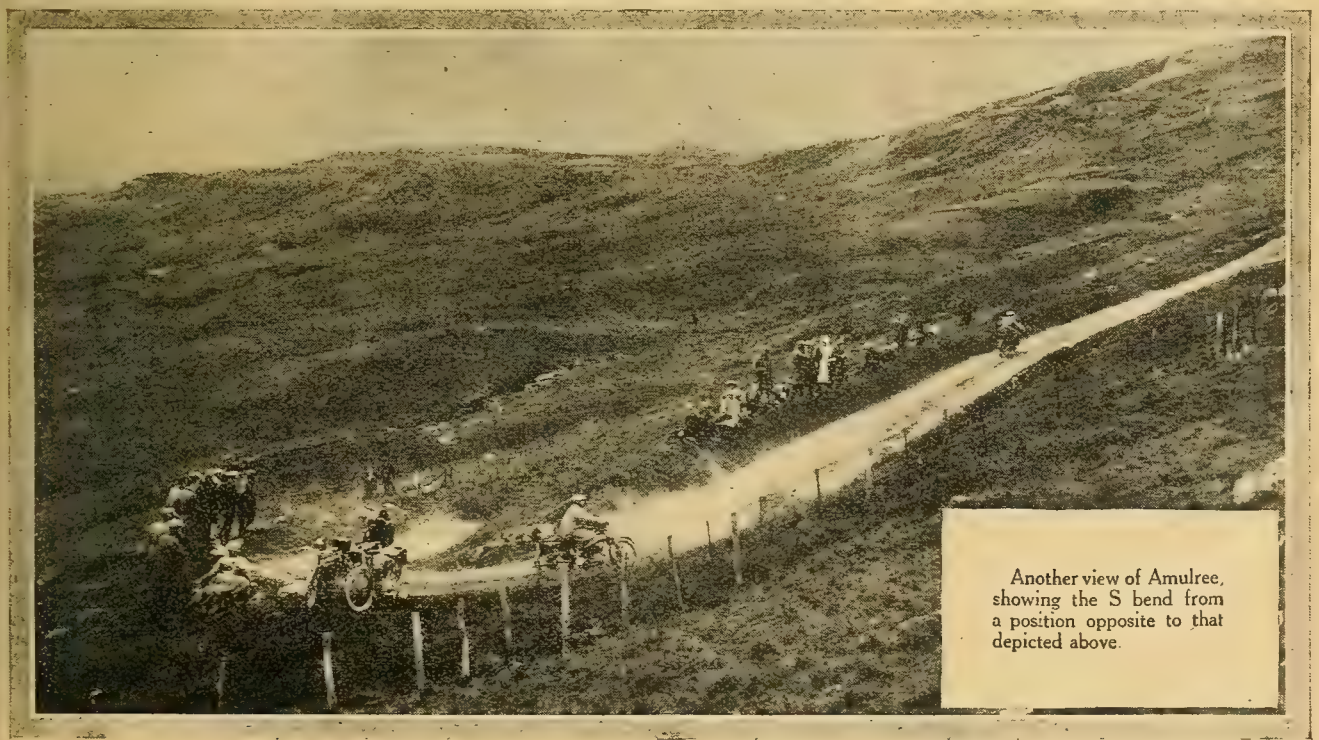
COUNTERSHAFT GEAR

Sturmey-Archer Gears, Ltd.,
Nottingham

Amulree is one of the best known hills in Scotland, and has two sharp hairpins, with gradients of 1 in 4½. No. 45, O. P. C. Collier (Beardmore-Precision), is seen on the bend.

followed a succession of rough gradients, both up and down, culminating in a fearsome hairpin, and after a mile or two of excellent road came the famous Cockbridge Ladder.

Somehow these, at one time appalling, hills have lost their terrors, and even the miles of rough hill with its many hairpins can be negotiated on middle gear by a well tuned "3½." For single-geared machines, however, the proposition is a stiff one. The enthusiasts riding these mounts take the trial in a most sporting manner, and one of the riders at least stops at the foot of each observed hill and removes the greatest possible amount of clothing in case violent assistance is necessary. Poor Carfrae, after a splendid ascent of the lower slopes, suffered belt slip on the upper section and had to foot slog.



Another view of Amulree, showing the S bend from a position opposite to that depicted above.

Scottish Trials.—

The rain which threatened at Cockbridge cleared off, and the scenery was gorgeous—in fact, only man and the road surface were vile, and the latter was truly so !

Mrs. Duncan Bell (6 A.J.S. sc.) on the "unobserved" hill out of Kirkmichael. This intrepid lady was also a competitor last year, when she secured a second-class award.

A series of cross gulleys continued for miles. Apparently, these gulleys followed the practice of waves on the seashore, since every seventh was the biggest; anyhow, sidecar frames had a bad time, and solo riders were none too comfortable.

Tomintoul was the next check, after which came a short steep hill over the Bridge of Avon. Then came the worst hill of the afternoon, covered with loose stones and having a very nasty corner. This, however, was not observed.

A mile or two further on came the Bridge of Brown, with the subsequent long ascent. This is an easy hill, yet it was interesting to watch the riders' methods.

"Bridge of Brown."

Campbell McGregor (3½ Brough single geared) and R. Carfrae (4 Triumph single geared) came up well; the Sunbeams, Blackburnes, P. and M.'s, and Rovers were noticeably silent. All the Nortons seemed to be well in hand, and both R. M. and Olive M. Knowles came up fast. B.S.A.'s and Matchless climbed steadily, as also did the 8 Clyno sc., handled by A. F. Knight. The Scotts purred up in faultless style, and the A.B.C.'s were fast but rather noisy.

E. A. Colliver and T. S. Sharratt (Indian scouts) made very pretty ascents, and Darnton, on a 7-9 model, soared over the top at great speed.

Just over the crest of the hill, J. Beck (8 New Imperial) stopped with rear wheel trouble, which subsequently led to his retirement. After a long descent, good surfaces followed to Carrbridge (check), and thence a fine road led to Inverness and the finish. This road was deceptive in places, and some of the pot-holes encountered in the last eight miles were very deep and yet not too easily distinguishable through the dust.

NOTES.

C. F. Plowman (4 Triumph) reported four falls before Braemar and talked of retiring, but finally decided to carry on

O. P. C. Collier (Beardmore-Precision) fell and damaged his machine so badly that he was unable to continue.

Archie Cocks (Beardmore-Precision) lost time through contact breaker trouble and dirty petrol filter.

The Ariel team have had tyre troubles, which led to loss of marks on time.

The following retired on the first day of the trial :

O. P. C. Collier (Beardmore-Precision).
R. G. McEwan (10 Richardson cycle car).
A. Alexander (7-9 Indian).
A. B. Fairley (2¾ Douglas).

SECOND DAY.

Observed Hill—Abriachan.
Total Distance 182 Miles.

THURSO, TUESDAY.

Last night there were rumours afloat that owing to the impossible state of the surface, Abriachan hill would not be observed. The scare was soon killed, for Major Watling, the manager of the Manufacturers' Union, who is acting as a steward, gave out that the hill was in a perfectly safe condition, and would be observed as previously arranged. Nevertheless, a notice was posted that extreme caution must be used at a certain point

A surface like a river bed, bends as sharp as a compressed letter Z, and gradients of 1 in 5, place Amulree among the worst hills in Great Britain. H. F. Barge (G.P. Morgan) was at a disadvantage by having to keep in the centre of the road, but he surmounted the hill without trouble.

The Can'opit lost the top of the float chamber.

A certain competitor has been awarded a clean ascent of Amulree but indignantly denies the honour and claims a failure. Next year we shall probably hear of a competitor in the M.C.C. team trial claiming an unobserved stop !

Choldcroft's 4 A.J.S. has a mysterious misfire which develops as a rule on observed hills. However, he has a clean sheet so far.

where the road is narrow and a steep bank slopes away for, perhaps, 300 feet. Such rumours are common at all big gatherings of motor cyclists, and the usual protests against lost marks were duly heard and considered. A wet start for the longest trip of the week was not encouraging, for Inverness does not look its best in a drizzle. However, the competitors seemed to be in good spirits, especially as the only observed hill came in the first ten miles.

Abriachan is a long steep hill, but looks much more formidable than it really is,

Scottish Trials.—

though there are a few rough bits and pot holes which require careful negotiation. No. 50 (R. Ball, 3½ Scott) started first to-day, so that the early comers were all in the fifties, which provided a change, both for spectators and competitors.

Observed hills in a strenuous six days trial are dull affairs unless there are a few hair-raising corners, for everyone but the single gear exponents drops into a low gear and takes no risks. At the same time it is interesting to watch the little machines and to study riders' methods.

Lightweights Doing Well.

The lightweight Clynos are performing very well. P. W. Bischoff rides like the old hand he is. C. V. Freeman is a good man, and was unlucky in shedding his oil filler and smothering the machine in oil, while Hugh Gibson, who is well known to all our readers, performed a wonderful feat after the lunch stop. His petrol union came adrift, with the result that he lost most of the contents of his fuel tank. He decided to return to Lairg and refill. Thus he lost very much valuable time, but in spite of this he made up lost time over the most appalling roads and checked in to time at Altnaharra.

But to continue our story in sequence. The view from Abriachan over Lochness is wonderful, and, in spite of the rain we were tempted to loiter, enjoying the view, which necessitated a "blind" over greasy tracks to regain time. During this section care was necessary to avoid skids, and it was wonderful to notice Jesse Baker and C. P. Wood (Scotts) making time steadily over the rough greasy tracks; the way the Scotts hold the road is astonishing.

Evanton was the spot selected for the first check after passing through Beauly and Dingwall. The tops of Ben Wyvis were shrouded in mist, and rain fell steadily as we swung left over a never-ending upward grade. The roads, however, were fairly good, and after eight or nine miles steady rise we made the close acquaintance of the heights above Bonar Bridge.

The corresponding descent is comparatively short and steep, and timber-hauling had not improved the surface. At Bonar Bridge a complaint about the rain drew unexpected comments from the natives, who have had no rain for six weeks, and whose water supply had been endangered. At this place also, those who had time were enabled to see a salmon net hauled, with satisfactory results, for several good fish were taken.

Another long climb through perfect scenery, the roads being bordered by silver birch, led to Lairg and lunch.

To competitors in the "Six Days," Scotland is all hills, and only a few of the most severe are "observed." In the top picture Capt. R. H. Hay-Hill (6 A.J.S. sc.) is seen on the "Bridge of Brown," and the bottom one depicts Mrs. Knowles (3½ Norton) and J. A. Hilger (5-6 Rover) on Cockbridge Ladder. These hills were two of the three "observed" tests on the first day of the trial. The centre picture shows T. S. Sharratt (Indian Scout) at Tomintoul.

Rain was now falling really heavily, and we could not help admiring the plucky performance of Mrs. Duncan Bell as we passed her piloting her A.J.S. sidecar over the flooded roads. After lunch came the test of the day, for the road to Altnaharra was a mass of loose stones and parallel ruts, which made steering a tricky job, especially for solo riders.

Many falls were experienced in this and the following section, some riders falling several times within forty miles of the lunch stop. Mrs. Knowles was seriously delayed with water in the magneto, and pluckily "blinded" to make up time over the villainous roads. In spite of an average which made many old hands shudder, it was impossible to save the situation, and she lost over an hour. Real hard luck!

From Altnaharra came an easy three track road round Loch Naver, but the road deteriorated near the Naver river, and became patched with loose gravel, which caused many spills. D. Wright, jun. (4 Blackburne), burst a tyre and had a nasty fall, causing his retirement, and several others fell, fortunately without serious damage. The last few miles to the check at Betty Hill were in good condition, and finished with a long easy climb to the village.

Nearing John-o'-Groat's.

Here competitors had their first glimpse of the North coast and the open sea. We were informed at the check that the subsequent roads to Thurso were good and hard. Hard, certainly! but good (?) not until the last ten miles. Nevertheless, after the fearful gruelling of the first forty miles from Lairg they were perfection, and none but those who have tried to average 20 m.p.h. over this awful stretch, with blinding rain against them, can imagine the severity of the trip.

From Thurso to John-o-Groat's is a twenty-mile run of fairly plain sailing, and at the latter spot the competitors were split up into two parties. From No. 1 to No. 50 returned to Thurso, while the remainder carried on to Wick.

NOTES.

An echo of the first day is worth quoting. A. Alexander (not A. H.) (7-9 Indian) had two punctures in the first twelve miles, and retired when his rear

Scottish Trials.—

tyre collapsed for the third time. This was very disheartening for a newcomer to competition riding, and we hope it will not influence a sporting competitor against future trials.

The streets of Thurso were strewn with nails, a foul trick which the police assisted in remedying to the best of their ability, and were sportingly helped by the Provost of the town.

A. J. Sproston (3½ Lea-Francis) broke his driving chain twice before lunch and twice more afterwards. He has also had trouble with his carrier, but finished well.

H. F. Barge (Morgan) retired with wheel trouble at Betty Hill.

Capt. Hay Wilf (A.J.S. sc.) had his sidecar off and was tinkering his machine just before Dingwall.

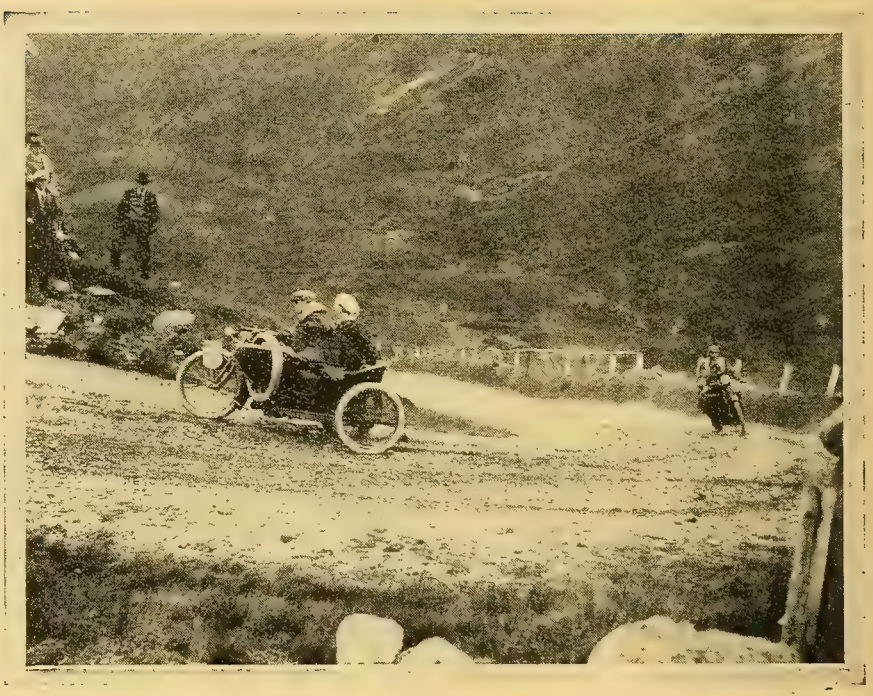
THIRD DAY.

No Observed Hills.
Total Distance 139 Miles.

INVERNESS, WEDNESDAY.

Bright sunshine, a short journey, and grand scenery combined to make the third day a comparatively easy one. The start took place at nine o'clock instead of eight, as on the two previous days, and on leaving Thurso an excellent road across the moors led to Latherton (the first check) and the coast. From this point a good road followed the coast line to Golspie, a distance of thirty-five miles.

One result of the good roads was that almost everyone arrived very early at the first check, though H. E. Fairley (3 A.B.C.) was delayed by tyre trouble, and the Rev. Philpott (2¾ Wilkin-Blackburne) was very late in starting owing to the fact that he ran out of petrol yesterday, and was forced to use paraffin, with the consequence that his carburetter was foul.



Rex Mundy piloting a Reading-Standard sidecar round the bend on the Spitall of Glenshee. An A.B.C. rider, E. E. Palmer, will be observed taking the bend on the outside.

The sporting spirit with which the trial is run was admirably exemplified at the Latherton check by one of the officials calling out the official time every minute, so that the waiting competitors might run in dead on time. The winding coast road afforded a wonderful view of the sea, with Tarbat Ness and the distant coast of Elgin in Banff on one side and of moor and mountain on the other.

Halfway between Latherton and Helmsdale lies Berriedale and the only steep hill of the day; the surface, however, was excellent, and many accomplished the climb on top gear. The second check was at Brora, and H. E. Fairley barely got in to time after mending his tyre. Tom Peck (3½ Ariel) retired in this section owing to a fractured piston when making up time after a puncture. The roads had been so good that a section of villainous timber-hauled road near Mound Station came as a shock, and for a hundred yards or so, many solo riders preferred to push their mounts rather than risk tyre trouble

A three-wheeler new to the big trials—the Merrall-Brown—near Dingwall.

Scottish Trials.—

A very long but gentle rise followed to Lairg, where lunch was again taken at the excellent Lairg Hotel. Thereafter yesterday morning's route was followed in the reverse direction, except that the Abriachan sector was cut out and the main Inverness road followed.

The scenery between Lairg and Evanton is indescribably beautiful, the moors after Bonar Bridge are in their summer coat of brown, since it is too early for the ling to be in bloom. Nevertheless, the sombre colours are relieved by the fresh greens of young bracken and hillside springs and patches of purple bell heather.

A few drops of rain fell near Evanton, but not enough to lay the dust, which was already beginning to rise in spite of yesterday's downpour. Dingwall, Muir of Ord, Beauly, and so home to Inverness, and everyone was glad of the easy run after yesterday's gruelling.

At the control, competitors were allowed time to change tyres, and some twenty took advantage of the opportunity. Tyre trouble has been the bugbear of the trial, Campbell McGregor has lost time through this cause to-day, and G. W. Lush (3 A.B.C. sc.) came in with his rear tyre in ribands.

Yesterday's run weeded out many competitors through falls and tyre troubles, and only half the trade teams are left with clean records.

Damaged footrests are common everywhere, and Hugh Gibson has been forced to spend much time fixing up his footrests with an elaborate rigging of copper wire. When he lays himself out to make up time for this purpose it is wonderful how the little Clyno covers the ground. Speed, it must be confessed, is rather a feature of the trial, and it is remarkably hard to pick up even one or two places if one's position is once lost.

A word must be said here for the wonderful organisation and the pleasant manner in which all the officials perform their many duties. Everything has run like clockwork, and there has been a wonderful absence of grumbles.

A Well-marked Route.

The method of marking the roads with powder is a distinct success, and though one or two went astray near Thurso this morning, the corner was easy to miss.

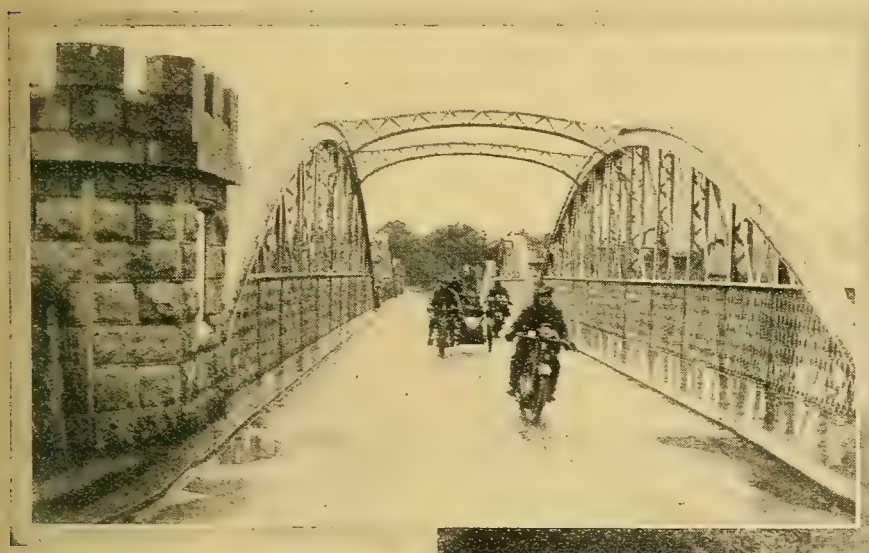
A complete list of marks lost yesterday was not available till this evening, since there was no telephone between Wick and Thurso. Each half list was, however, posted in the respective official hotels, though many of the tired riders went to bed early without bothering to find out their official gate.

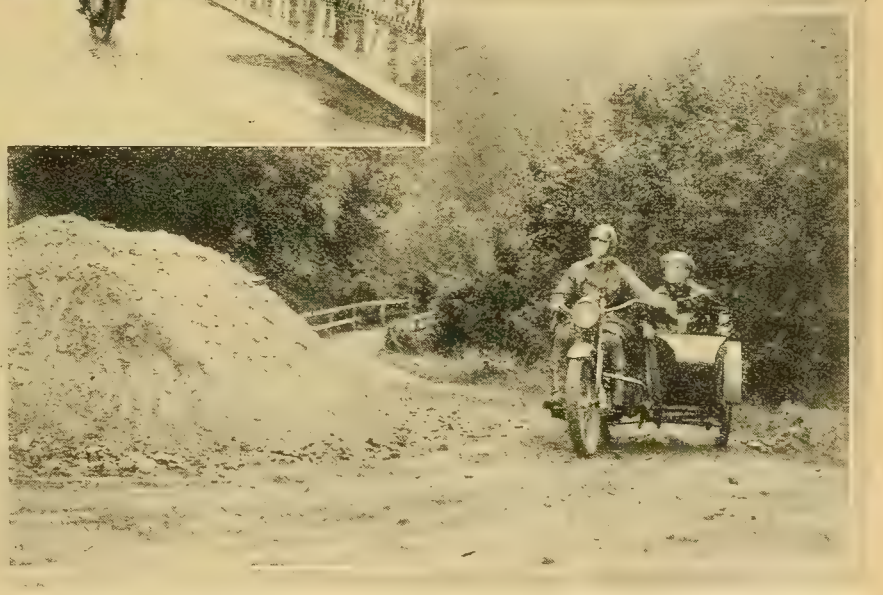
Who was the sportsman who several times stopped to borrow hairpins from the native damsels in order to keep a valve rocker in place?

Campbell McGregor's luck as regards tyre trouble threatened to rival that of Claude Duncan last year. Five punctures per day is about his average, but he is still in for a possible silver. Keen rivalry exists between the ex-secretary and Carfrae, the former on a Brough and the latter on a Triumph, for the single-gear award.

Caithness truly gives the impression of a foreign land. The man from the South cannot help but be struck by the peculiarity of the huge stone slabs, placed on edge, to function as walls. This is a land of great distances, and to the south lie the Highlands in blue and rugged ridges.

The natives of this land seem to have an understanding with their animals. One sees horses confined to their paddocks by the stone slab fences no higher than their knees, apparently making no attempt to escape into the next door neighbour's mustard patch; such equine conscientiousness really must be peculiar to Caithness.





AT BONAR BRIDGE.

(Top) Competitors crossing the Kyle o Sutherland at Bonar Bridge, between Evanton and Lairg.

(Bottom) D. M. Hamilton (Harley-Davidson) taking the S bend on Abriachan Hill, nine miles from Inverness.

NOTES.

The Rev. Philpott had a run of real bad luck yesterday. After a series of minor mishaps he fell into a ditch while making up time. So deeply was his machine embedded that it required the help of two men to get it out. Subsequently, he ran out of petrol, and the only available supply of paraffin carried him within two miles of the check.

Leaving Thurso, Hutchinson (Indian sc.) and Fairley (A.B.C.) took the wrong road and went sixteen miles out of their way. They made up the time on the twenty-six-mile check.

A busy scene in the check at Latherton on Wednesday. Most of the competitors seized the opportunity of effecting minor adjustments.

One sign of the ever-increasing interest of the public in motor cycles is the attention now given to big trials by the newspapers. Many of the London dailies send representatives to report such events as the Scottish trials day by day, but these telegraphed reports are not always to be depended upon. For example one of the national daily papers gave a summary of the trial up to Wednesday night—half way through the trial—which gave the impression that fully half the competitors had retired and that only one manufacturer's team had any chance of winning the coveted team prize.

Instead of fifty per cent. retirements, the figure was only twenty per cent., while at least four teams had so far got through without loss of marks. These were the A.J.S., B.S.A. No. 1, P. and M., and Matchless teams, while the Indian trio had only one mark to its debit account.

The first three days accounted for nineteen retirements out of the ninety-four competitors who started. A further eighteen had lost marks.

FOURTH DAY.

Observed Hills—Mam Ratachan and Glendoe.

Total Distance 159¾.

THURSDAY.

A dull morning with intermittent rain. The optimists promised that the clouds would lift, and their prognostications were justified in that a moderately fine morning resulted.

The route led down the north side of Loch Ness, past the foot of Abriachan to Drumnadrochit and the Invermoriston Hotel (first check). The road was easy and the scenery superb, but the surface of the road for the last few miles was such that one was apt to pay more attention to keeping a straight course than to the view, especially as only a thin hedge separated the road from a 100 feet drop into Loch Ness.

R. Carfrae (Triumph) had the misfortune to break his fork spring in this section, but carried on after strapping up the fork.

From Invermoriston the road led through silver birches with a mountain torrent on the left, but these pretty scenes soon changed to the grander and impressive mountain scenery of Glen Cluanie.

A loose surfaced mountain road led up the glen, and the mountains at the head were shrouded in mist. Travelling through the heart of a deer forest with great hills on both sides, one's eye naturally strayed from the road in search of stags, but we were vouchsafed only a glimpse of a herd in a sheltered corrie and an attempt at a better view nearly cost us a spill.

C. P. Wood and W. L. Guy near Port Gower. These two riders have again demonstrated the wonderful steering qualities of their Scott machines on hills and rough surfaces.

Difficult Road Conditions.

C. P. Wood (3¾ Scott) fell out in this section and thus spoiled the record of the Scott teams. The descent from the top of the pass was tricky in places, as the loose shingle surface was difficult for the solo rider, while the three ruts were an awkward fit for the sidecar machines.

Next came the ascent of Mam Ratachan, a four-mile grass surfaced hill, two miles of which were observed. The climb was easy enough as far as the gradient was concerned, but half-way up the surface had been "repaired" with earth and stones.

This portion caused a lot of trouble, since the wheels sank in to a depth of six inches in places. One would have been inclined to say that the surface was unfair had not H. M. Batten (3½ P. and M.), L. Guy (3¾ Scott), and J. A. Newman (3½ Sunbeam) made absolutely clean ascents, without even moving their feet

Scottish Trials.—

from the rests. A. Downie (2¾ Wilkin) made an extremely fine climb, as also did Mrs. Bell (A.J.S. sc.), N. Black (3½ Norton), and J. S. Holroyd (8 Blackburne sc.). The Harley-Davidsons made good steady climbs, and R. E. Darnton got over the worst bit in fine form, though he had the misfortune to break a chain within a few yards of the end of the observed section.

W. Westwood (4 Triumph chain drive), who has been riding most consistently throughout, climbed excellently, but spoiled his record by bouncing into a ditch and stopping, as a result of an early change to top gear. There were many failures on this hill. A long grassy descent followed to Glenelg and lunch. Glenelg, by the way, is within a mile or two of the Isle of Skye, and many people were deceived in thinking that the adjacent mountains were part of that island.

More Rain.

After lunch the morning's route was reversed as far as Cluanie, and it was interesting to find that almost everyone considered the descent of Mam Ratachan steeper than the ascent.

At Cluanie the right hand fork was taken, and a long climb over loose metal with a corresponding descent led to a check at Tomdoun.

Rain fell steadily over this sector, and quite a lot of trouble was noticeable on the rises. Incidentally it was worth while watching H. B. Denley (8 Morgan) making up time over mountain roads; stones flew in every direction and the rear wheel seemed to cover the whole road. Alan Hill (3½ P. and M.), a most careful and steady rider, fell near Tomdoun, and J. Baker (3¾ Scott) took a nasty toss while ascending the reverse side of Mam Ratachan. Falls throughout the day were numerous, and T. S. Sharratt (Indian Scout), who is a good and steady rider, fell no fewer than three times.

From Tomdoun to Fort Augustus the road was easy, though twisty and wet, the last few miles being accomplished against a strong head wind and stinging rain.

Directly after the town came the ascent of the first part of Glendoe—a second gear climb—thence a short descent, and the final part of the hill—a short section of 1 in 3 with two nasty corners.

There were a few failures at this spot, but quite one of the best climbs was made by Mrs. Olive M. Knowles (3½ Norton). Rain now began to fall in earnest, and it was hard to see more than a few yards ahead. The roads were quickly flooded, and the next few miles over the moor were anything but pleasant.

Now came a détour to Craggie Inn, including nearly ten miles of logging road which was quite unrideable at 20 m.p.h. This is the first section which has given cause for a grumble, for it distinctly penalised the steady rider and favoured the man who "blinds." It is true that in dry weather the roads might be rideable.

NOTES.

Jesse Baker, who has not long recovered from a nervous breakdown, has suffered severely from his fall. Under the circumstances the judges allowed C. P. Wood to ride his machine for the concluding stages of the trial.

Westwood Wills (2¾ Verus) retired with water in the magneto.

Hamilton (Harley-Davidson sc.) smashed up badly after leaving Thurso. He took a right hand bend too quickly, and buckled his front wheel.

The Clyno lightweights put up some remarkable performances on the hills, hence P. W. Bischoff's happy smile!

FIFTH DAY.

Observed Hill—Kenmore.
Total Distance 190¾ Miles.

EDINBURGH, FRIDAY.

A long day, but a day of good roads. The starting time was changed from 8 to 9 o'clock, owing to arrangements for lunch, and Monday's route was followed in a reverse direction as far as Carrbridge. Thence to the second check at Newtonmore all over main roads.

There was but little incident thus far, except that the Merrall Brown shed a fan and damaged the radiator, and the majority had time in hand at the check. Near Struan, however, on the moorland road, E. Palmer (3 A.B.C.) retired with a broken camshaft.

A fearful rainstorm broke in the Grampians, and in five minutes the road became a torrent. One or two competitors took shelter under a bridge, but the majority preferred to have plenty of time in hand, especially as the Dalnacardoch check was only a comparatively short journey ahead.

Close to the bridge just mentioned, T. Morton (4 Blackburne) ran into a Ford, and was forced to retire; an unfortunate accident for which the blinding rain was partly responsible. Between Dalnacardoch and Pitlochry, R. E. Darnton (7-9 Indian), who had been riding very regularly, lost his chance of a gold medal by suffering tyre trouble; even after a repair the tyre went down in four miles, and he checked in three minutes late.

The Rev. J. M. Phipott, who had been struggling gamely against a host of minor troubles, was forced to retire at the lunch stop, since his carrier and mudguard carried away and fell backwards on to the road. He finished the last five miles holding the carrier in position with one hand, but gave up at Pitlochry. A most excellent lunch was served at the magnificent hydro, the liquid refreshments being arranged by the officials of the Edinburgh club.

After lunch Darnton was again unlucky, for, being short of petrol, he was directed to Aberfeldy as the nearest place where replenishments could be obtained. This led him seven miles off the course, and, in spite of a wonderful effort to regain time, he checked in late at the top of Kenmore.

Two miles of wet and deeply rutted roads led to Kenmore village, immediately after which comes the famous hill. Rising from Loch Tay, the narrow road climbs sharply for over four miles, and includes four hairpin bends. The bottom section was badly cut up, and very soft, but the upper corners were fairly hard, though rough and stony.

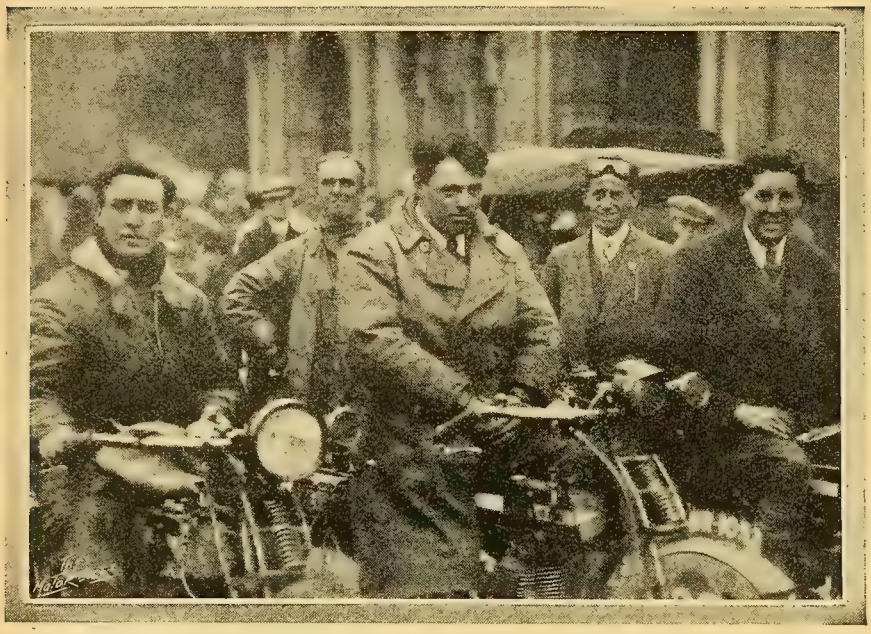
The Difficult Ascent of Kenmore.

Amongst the nine failures were Robert Carfrae (4 Triumph single-gear), who made a plucky attempt, and Alan Hill (3½ P. and M.), who was severely handicapped by the fact that yesterday's fall had damaged his leg to such an extent that he was unable to use it to steady himself. T. S. Sharratt (Indian Scout), H. F. Mase (3 A.B.C.), J. R. Fellows (3½ James), J. S. Holroyd (8 Blackburne sc.), J. Shepherd (8 Campion sc.), G. W. Lush (3 A.B.C. sc.), and S. Hubbard (2¾ H.B.), also failed to make clean ascents. Exceptionally good climbs were made by H. R. Davies (6 A.J.S sc.), Mrs. Bell (6 A.J.S. sc.), Olive M. Knowles (3½ Norton), and J. A. Newman (3½ Sunbeam). D. H. Noble and J. A. Hilgar were riding their 5 Rovers very well and steadily, and their performances were again good. Except for Alan Hill's unlucky failure, the new P. and M.'s are showing up well on hills and and rough surfaces, and all the Sunbeams climbed well.

C. P. Wood, riding Jesse Baker's Scott, was baulked, and had to cut the second corner very closely, but he got up, with one dig to steady himself. H. B. Denley's Morgan climbed well. This machine runs very nicely, and will tick over very quietly, besides developing plenty of power. The Merrall Brown was the only other three-wheeler left, and made a clean ascent, though nearly turned over in descending Amulree.

The drop down Amulree was followed by good roads until nearing Gilmerton, where the surface was greasy and full of pot-holes. At Crieff, one and a quarter mile further on, another cloud burst overtook the competitors. So heavy was the rain that it was impossible to see more than a few yards ahead, but the storm was purely local, and within a few miles the roads were quite dry again.

After lunch, and provided, of course, that competitors were up to time, the checkers were lenient as regards the times



The winning team: L. L. Sealey, F. Turvey, jun., and H. F. Edwards, on their B.S.A. machines. They thus repeat their performance in the 1919 English Six Days.

of departure, and at the Stirling check many spent their spare time in plastering their magnetos with grease in preparation for the watersplashes on to-morrow's course.

After Stirling one leaves Highland scenery and the remainder of the run to Edinburgh is rather dull, and the miles seem unduly long. Neither Falkirk nor Linlithgow is impressive, and the excellent roads between were the saving grace.

Owing to the late start and the great distance covered, the first man was not due in Edinburgh till about 7.30, and consequently the day's results were late in posting.

SIXTH DAY.

Observed Hills—Talla Linn, Redstone Rig, Elmscleuch.

Total Distance 155½ Miles.

EDINBURGH, SATURDAY.

There has been much discussion about the severity of this day's run, but in actual practice there can be no complaints, since it proved to be less arduous than some previous days. True, there were two sections which required skilful driving and which were apt to penalise a mistake rather severely, but the remainder of the route was on the easy side.

Unfortunately, the club has been unlucky this day, and the route marking Ford broke a stub axle, with the result that parts of the road were badly marked and the Haddington check was altogether missing owing to the fact that the second official car, which went to the aid of the first, developed a series of minor faults which delayed it considerably.

Before twenty miles of the run had been covered rain began to fall steadily, but a strong wind arose which dispersed the clouds, and only intermittent showers were experienced after the thirtieth mile.

The first hill—Talla Linn—is a fine straightforward climb of considerable length and gradient, but was responsible for one failure only, S. Hubbard (2¾ H.B.) being the unlucky rider; though G. Shaw (4 Norton) had rear wheel trouble near the hill. The Ariels and P. and M.'s climbed steadily, but there were no very outstanding performances.

Next came a run of moorland tracks with a few watersplashes which, curiously enough, were responsible for considerable tyre trouble. J. A. Dias (3½ P. and M.) punctured, but checked in to time; T. Rutherford had similar trouble but was less fortunate; and R. Fellowes (4 Triumph) came into the lunch control at Innerleithen with a flat tyre. M. Brown (Merrall Brown) had trouble in a splash and nearly collided with a sidecar, but continued all right.

The next section provided good going, and, with the exception of the effects of a strong head wind, but little incident.

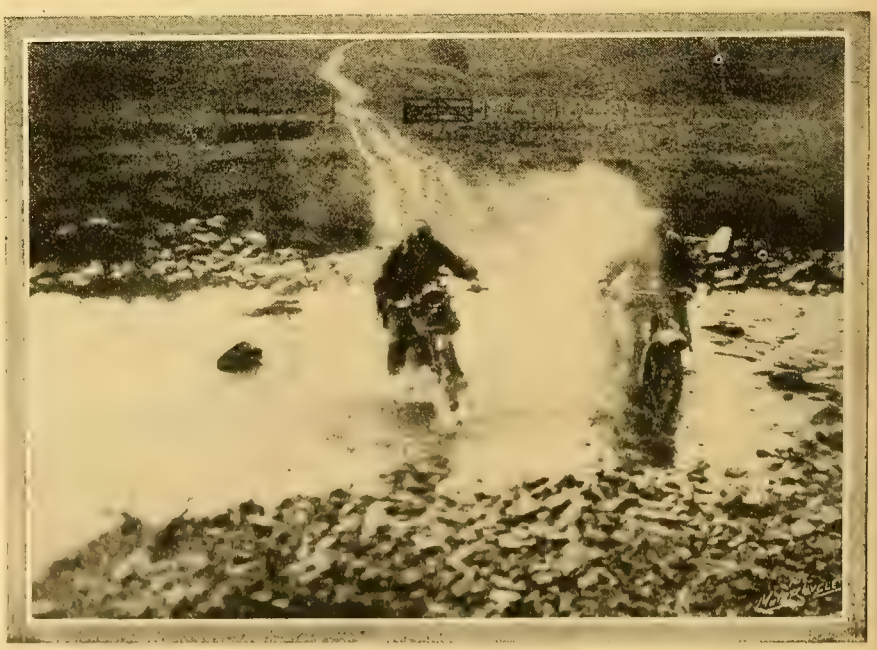
At Gifford, some competitors arrived before the checker, who turned up, however, in time to send them off to tackle Redstone Rig a few miles further on. This is an easy hill, and the only failure was that of R. E. Darnton (7-9 Indian), who was making a fast ascent when his engine gave out owing to carburetter trouble.

Tricky roads followed, and after a time all signs of route marking gave out. A few of the early numbers went astray, but soon regained the road, and the remainder were able to follow their tracks. Narrow, greasy roads, with occasional watersplashes and many corners, made time-keeping none too easy.

Grass and Watersplashes.

Directly after the check at Elmscleuch came the ascent of Elmscleuch Hill, a long, but simple climb, insufficiently steep to cause trouble. Then followed a grassy track and a few watersplashes, and an unobserved hill of some severity, starting with a splash at the bottom. This hill is known as Crickness, and though short has a steep, loose surface with a left-hand hairpin. Then followed a descent past Agnes Farm to the deepest splash of the day; but, in spite of wild rumours beforehand, it proved quite rideable, being about 20ft. wide and perhaps a little over a foot deep.

H. M. Batten (3½ P. and M.), after a wonderfully regular performance and steady climbing, nearly lost his gold medal at Elmsleuch owing to chain trouble. W. Chambers (3½ B.S.A.) had ignition trouble near the same spot. Both, however,



This is what competitors had to contend with on the last day. R. Fellowes (Triumph) and A. Downie (Wilkin) negotiating the rock-bottomed stream at St. Agnes Farm.

Scottish Trials.—

succeeded in evading penalty. N. Black (3½ Norton) retired with a damaged gear box on Elmscleuch Hill—a piece of bad luck after his consistent performance on all the preceding days.

Near St. Agnes Farm G. W. Lush (3 A.B.C. sc) broke a fork, and retired.

After the big watersplash the roads improved, and Snout Hill proved an easy climb.

Following the descent of Redstone Rig a very twisty and greasy course was followed. This sector included two hills at least as bad as the observed hills and two really severe hairpins. Had there been a check at Haddington, as intended, it is quite possible that a few more gold medals would have been lost on this part of the course.

Competitors entered Haddington by more than one route owing to the failure of the arrowing, and, in the absence of the checkers, carried on to Edinburgh over moderately decent roads.

Mrs. Bell, who has driven her A.J.S. and sc. most pluckily throughout, had engine trouble within a mile of the finish, a piece of almost inconceivably bad luck. She was towed in by H. R. Davies on a similar outfit and finished to time. H. M. Batten finished with a flat tyre, and in spite of a broken fork spring Robert Carfrae brought his single-geared Triumph safely home. He was the only one of his class to finish and put up an extraordinarily fine performance

NOTES.

Hugh Gibson finished with a clean sheet, a wonderful performance for so small a machine as the 2½ Clyno, especially after a nasty fall on the Spittal of Glenshee. On the last day his gear lever broke, but he continued the journey holding the gear control in position with one hand.

The Edinburgh and District Motor Club, Ltd., are to be heartily congratulated on the success of a very sporting trial. The failure of the route marking car and its relief on the last day was the only hitch, and nobody was more grieved over this failure than the club officials themselves.

The officials have decided to disqualify Mrs. Bell—presumably on the ground that her machine did not finish in running condition. Strictly speaking this is probably a correct decision, though our sympathies go out to Mrs. Bell, who put up a most plucky performance and completed the course to within a mile of the finish.

A lady's gold watch was found at the Royal George Hotel, Perth. The owner may recover her property by applying to the Edinburgh and District Motor Club, Ltd., 6, Castle Street, Edinburgh.

Not the least fascinating part of the Scottish Six Days is that it embraces some of the most magnificent scenery in the British Isles. Norman Black (Norton) near King.

Provisional Results of the Scottish Trials.

94 Starters. 26 Gold (including six sidecars), 18 Silver, and 9 Bronze Medals. 4 Retired Monday, 14 on Tuesday, 2 on Wednesday, 7 on Thursday, 9 on Friday, and 3 on Saturday—Total 39.

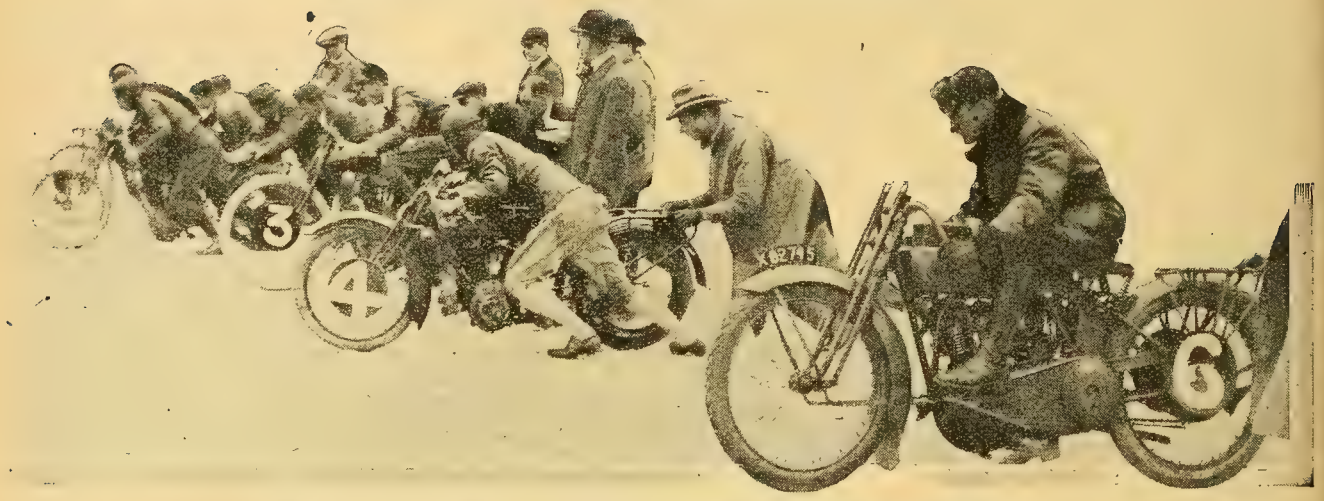
Club-men on Brooklands.



THE SEVENTH ANNUAL M.C.C. RACE MEETING.

A FAIR attendance, good racing, and indifferent weather were the chief features at the first race meeting held by the Motor Cycling Club at Brooklands since the war on Saturday last. Naturally, the weather affected the gate, but the rain, though trying at times, was not bad enough to spoil the racing.

The first event was the handicap race for motor cycles with engines not exceeding 350 c.c. Distance three laps. The start was at the paddock, the competitors passed the fork twice, and finished at the straight on the long finishing line.

Among the entrants was a scooter, but it did not materialise. Jacob's Singer was eight years old, but, apparently, not in its usual form, as it failed during the race, having lost all its compression.

The 350 c.c. Handicap.

E. B. Ware got away particularly well, making a fine start with his clutch. F. W. Applebee (Levis), despite his years, was very active in leaping on to the saddle, and, as usual, made a fine performance.

The first lap order was Applebee (Levis), F. Thorpe (Douglas), J. F. Hull (Wooler), S. E. Longman (Wooler), L. A. Baddeley (Douglas), J. S. Bennett (Metro-Tyler), A. H. Ilsley (Matchless), E. B. Ware (N.U.T.-J.A.P.), and A. C. Robbins (Wooler).

In the second lap Applebee and Thorpe were running a close race, while Hull came after, followed by Longman, Baddeley, and Robbins some distance after. Result :

	Bore and Stroke.	Start. m. s.
1. A. H. Ilsley (Matchless M.A.G., 2-cyl.)	54 × 75	—
2. F. W. Applebee (Levis, 1-cyl.)	67 × 70	1 39
3. F. Thorpe (Douglas, 2-cyl.)	60.5 × 60	1 12

The first three finished close together, and, after an interval came :

J. F. Hull (Wooler, 2-cyl.)	60.5 × 61	1 27
L. B. Ware (N.U.T.-J.A.P., 2-cyl.)	60 × 61	

Time, 2m. 12⅘s. Winner's speed, 65¼ m.p.h.

Many complimentary remarks were heard on all sides concerning Mr. Ebblewhite's handicapping in this race.

The second race was the 2.50 p.m. handicap motor cycle race for motor cycles with engines exceeding 350 c.c., and not exceeding 560 c.c. Distance three laps.

In the first lap the limit man, Longman (Ariel), maintained his lead by a considerable distance. Then followed Harveyson (Indian), Kaye Don (Norton), and Emerson (A.B.C.) in the act of passing C. R. Collier (Matchless). In the second lap Don was leading, followed by Emerson, Harveyson, and Collier. Result :

	Bore and Stroke.	Start. m. s.
1. R. Kaye Don (Norton, 1-cyl.)	79 × 100	9
2. J. L. E. Emerson (A.B.C., 2-cyl.)	68.5 × 54	—
3. C. R. Collier (Matchless M.A.G., 2-cyl.)	64 × 77	9
H. R. Harveyson (Indian, 2-cyl.)	68.2 × 67.8	21

Time, 7m. 22s. Winner's speed, 67¼ m.p.h.

R. Kaye Don, who won the handicap race for machines over 350 c.c. and under 560 c.c. on a 3½ h.p. Norton. His speed was 67¼ m.p.h.

The third race was the 2.50 p.m. handicap motor cycle race for motor cycles with engines exceeding 560 c.c., and not exceeding 1,000 c.c. Distance three laps. The most surprising feature of this race was the speed of Gayford's Zenith. He was leading easily in the first lap, followed by Temple (Harley-Davidson), S. Garrett (Indian), V. Olsson (Indian), and McBirnie (Indian). In the second lap Gayford was still leading and increasing his lead, which Garrett and Olsson followed. At the finish Gayford won literally by miles. Result :

	Bore and Stroke.	Start. m. s.
1. V. Gayford (Zenith, 2-cyl.)	76 × 82	1 27
2. S. Garrett (Indian, 2-cyl.)	79 × 100	21
3. V. Olsson (Indian, 2-cyl.)	79 × 100	21

Time, 7m. 59s.

The fourth race was the 3.20 p.m. scratch race for motor cycles with engines not exceeding 350 c.c. Distance two laps. First prize "Arbuthnot" Cup, to be won outright. The chief item of interest in this race was Axford's A.J.S., which was one of the I.O.M. machines which he brought easily to victory by about a mile. C. R. Collier made a bad start, but Ware, as before, got away well. Result :

	Bore and Stroke.
1. S. R. Axford (A.J.S., 1-cyl.)	74 × 81
2. E. B. Ware (N.U.T.-J.A.P., 2-cyl.)	60 × 61
3. F. Thorpe (Douglas, 2-cyl.)	60 × 60

Time, 5m. 55⅘s. Winner's speed, 58½ m.p.h.

A Fine Scratch Race.

The fifth race was the 3.40 p.m. scratch race for any type of motor cycle with engine not exceeding 560 c.c. Distance three laps. The feature in this race was Emerson's performance. His A.B.C. machine was practically standard save for a few details. He made a wonderfully good start, and finished first by three-quarters of a mile in neutral with the engine stopped. The order at the end of the first lap was Emerson leading easily, Colver (Matchless), Axford (A.J.S.), Thompson (A.B.C.), and Don (Norton); at the end of the second lap, Emerson had increased his lead, and was followed by Don and Axford. Result :

J. A. Masters (Harley-Davidson), second in the three lap sidecar race.

	Bore and Stroke.
1. J. Emerson (A.B.C., 2-cyl.)	68.5 × 54
2. Kaye Don (Norton, 1-cyl.)	79 × 100
3. S. R. Axford (A.J.S., 1-cyl.)	74 × 81

Time, 7m. 20⅘s. Winner's speed, 67¾ m.h.p.

The sixth race was the 4 p.m. scratch race for any type of motor cycle with engine exceeding 560 c.c. but not over 1,000 c.c. Distance three laps. First prize "O. C. Godfrey Cup."

Harveyson (Indian) shot ahead at the outset and rapidly increased his lead, he looked like winning by miles, but in the last lap his front tyre came off, Result:

	Bore and Stroke.
1. S. Garrett (Indian, 2-cyl.)	82.5 × 93
2. C. F. Temple (Harley-Davidson, 2-cyl.)	84.1 × 88.9
3. V. Gayford (Zenith, 2-cyl.)	76 × 82

Time, 7m. 25s. Winner's time, 67½ m.p.h.

The seventh race was the 4.30 p.m. handicap sidecar race for any single cylinder motor cycle with sidecar, stripped or otherwise. Distance two laps.

The first, second and third men came in at short intervals, with the fourth man arriving late. Result:

	Bore and Stroke.	Start. m. s.
1. P. G. Kennedy (Rudge 1-cyl.)	85 × 88	1 36
2. F. A. Longman (Ariel, 1-cyl.)	86.4 × 85	1 48
3. Capt. M. C. Breese (Triumph, 1-cyl.)	85 × 88	1 2
F. Savage (Triumph, 1-cyl.)	85 × 97	1 28

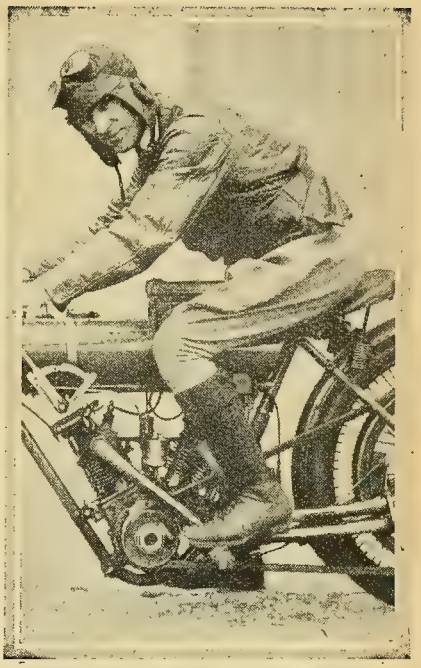
Time, 7m. 51⅕s. Winner's speed, 43 m.p.h.

The 4.50 p.m. handicap sidecar race for motor cycles with sidecars, stripped or otherwise, brought out the big twins. Distance, three laps. First prize, "The Captain's Cup," presented by Mr. W. H. Wells. Fork start, pass fork twice, and finish in straight at the short line. Crossthwaite (James), the limit man, astonished the spectators by his speed at the outset, as he was rounding the bend near the fork when the scratch man (Harveyson) started, but he was not a survivor. Result:

	Bore and Stroke.	Start. m. s.
1. J. Chater-Lea (Chater-Lea, 2-cyl.)	86.5 × 85	1 9
2. J. A. Masters (Harley-Davidson, 2-cyl.)	84.1 × 88.9	1 9
3. S. E. Longman (Harley-Davidson, 2-cyl.)	84.1 × 88.9	1 24
R. Deguin (Zenith, 2-cyl.)	76 × 82	1 36
F. J. Watson (Ariel, 2-cyl.)	67 × 95	2 12
V. Olsson (Indian, 2-cyl.)	79 × 100	1 9
M. H. Selby (Harley-Davidson, 2-cyl.)	84.1 × 88.9	1 24
H. R. Harveyson (Indian, 2-cyl.)	82.5 × 93	—

Time, 10m. 50⅕s. Winner's speed, 46 m.p.h.

The ninth event was the handicap light car race won by R. C. Empson (two-cylinder A.V., 85.5 × 85 mm.). 33s. start. Time, 10m. 29⅖s. Speed, 48¼ m.p.h.



A. H. Ilsley, riding a 2¾ h.p. Matchless fitted with M.A.G. engine, won the race for machines under 350 c.c. His speed was 65¾ m.p.h.

The final motor cycle event was the club championship for the "Harry Smith" gold challenge cup. Open to successful competitors in the first three events. Distance, ten laps. It was an excellent race, the first three men finishing within 16s. Results:

	Bore and Stroke.
1. Kaye Don (Norton, 1-cyl.)	79 × 100
2. J. Emerson (A.B.C., 2-cyl.)	68.5 × 54
3. J. F. Hall (Wooler, 2-cyl.)	0.5 × 60

Time, 36m. 17s. Winner's speed, 60.18 m.p.h.

Mrs. Bell (A.J.S. sc.), near Dalwhinnie, in the Scottish Trials. After a sporting ride, Mrs. Bell unfortunately failed within a mile of the finish

CURRENT CHAT (Continued from p. 70)

Police Activity.

A correspondent informs us that the police are very active in Conway and Penmaenmawr, in North Wales. He speaks very well of the behaviour of the police in Llanfairfechan and Bangor.

A Stolen Triumph.

Readers are warned against purchasing a second-hand countershaft Triumph bearing the following numbers: frame, 285326; engine, 57868; magneto, M-L 24775. This machine was stolen from Army Headquarters, Aldershot.

The Proposed French Sidecar Tax.

Our French friends are very much exercised concerning the proposed law which, if passed, will entail owners of sidecar machines paying the same tax as motor car owners. The idea is to tax the sidecar according to horse power. There is, of course, the chance that the law may be read to understand that the sidecar outfit is a motor cycle paying 12 frs. a year. On the other hand, there is a danger that the sidecar outfit may be accounted a motor car. If this is the case, a 5-6 h.p. sidecar outfit will have to pay a tax equivalent to about £11 10s.

The law has actually passed through the Chamber of Deputies and the Senate, and, unless arrested, will go into effect next year. There is just one ray of hope. Before being finally accepted, the general Budget proposals will come before Parliament, and an effort will then be made to rectify this extraordinary and unjust piece of legislation. If this effort fails, it is certain that the sidecar will disappear from the roads of France, and an industry which is on the point of bursting into activity will be killed. Instead of increasing the revenue, the State will therefore be the loser.

The underlying thought in this measure appears to have been that cycle cars in France are taxed as cars, and that the same treatment should be meted out to sidecars.

Imports and Exports.

Imports of motor cycles each month remain at a fairly consistent level, though June figures show a slight increase on the previous month.

IMPORTS FOR JUNE.

	1913.	1919.	1920.
Number of machines	243	6	254
Value of machines and accessories ...	£22,066	£4,499	£29,418

BRITISH EXPORTS.

Exports of motor cycles, like the imports are not varying much from month to month. There is a very slight decrease to record, as against May's exportation.

EXPORTS FOR JUNE.

	1913.	1919.	1920.
Number of machines	1,419	678	1,405
Value of machines and accessories ...	£80,938	£66,959	£154,586

The total value of motor cycle and accessory exports for the last six months amounted to £852,523 compared with £468,758 in 1913. Considering the extraordinary demand of the home market during this year, the figures would show that our manufacturers have not been neglecting the overseas market to the degree that some critics have asserted.

A One Day Trial in Lakeland.

What promises to be a very sporting event will be held on Saturday next, in the northern portion of the Lake District. This is the open one-day reliability run organised by the Cumberland County M.C.C., for which an entry of sixty-one has already been obtained.

As one of the twenty "supported" events many prominent riders are competing, including G. Dance, T. C. de la Hay, and E. Williams, on Sunbeam machines. There are many valuable awards, including the Alan Trophy for best individual performance and the Cumberland County Trophy, the Carr Cup, and the Barron Trophy, for best performances in the solo, light car, and passenger machine classes respectively.

International Six Days.

Competitors for the French International Six Days Trial number twenty-three riders. This event is the French equivalent to the Scottish Six Days.

British entries are exceedingly few, which may be due to the Paris-Nice fiasco. The following are the names of the solo entrants: Sermens (Giller), B. Gold (Wolf), Alfter (Condor), H. Naas (A.B.C.), Detruche (A.B.C.), Yenné (A.B.C.), Duverue (Rudge-Multi), Mahieu (Rudge-Multi), Gabriel (Triumph), Belli (Magnat-Debon), André (Motosacoche), P. Gonnell (Motosacoche), Pinney (Triumph), Bernard (Indian), H. P. Lucas (Zenith).

SIDECARS.—A. Gallien (Benoit-Gonin), E. Gex (Motosacoche), S. Barron (Harley-Davidson), and — Sandford (Morgan). There are also three Scotts and one Triumph entered, the riders of which have not yet been nominated.

The following is the French team entered for the "Concours International de Tourisme": H. Naas (solo A.B.C.), Gabriel (solo Triumph), and A. Gallien (Benoit-Gonin sc.).

Route Marking.

Aniline dye will be used to mark the routes for the A.C.U. Six Days trial in August.

A Club Rally.

Secretaries of London clubs are reminded of the forthcoming rally fixed for August 8th, and those who have not already communicated with Mr. B. Staley, Victoria Avenue, Finchley, N.6, with a view to participation, are requested to do so, in order to make the event a success.

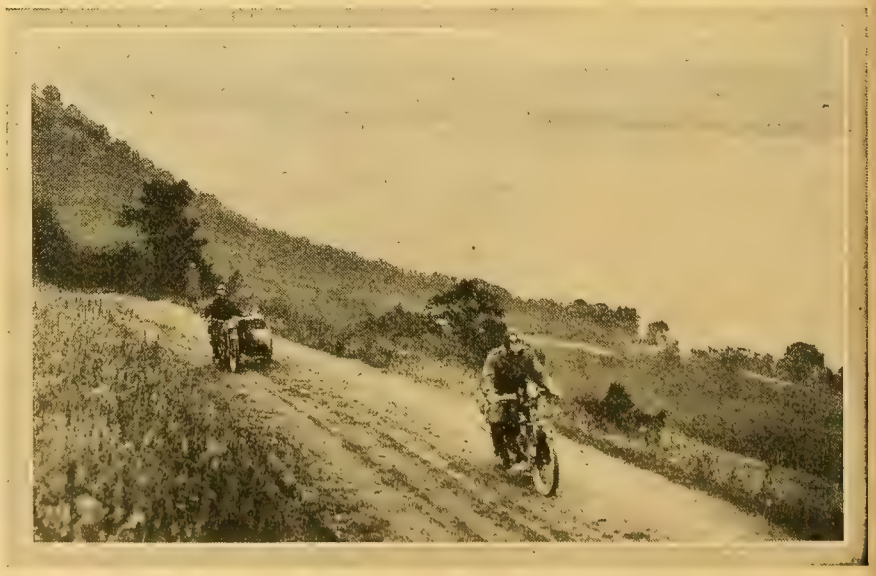
Candour and Otherwise.

Like *The Motor Cycle* Query Department, the A.C.U. are bombarded with all kinds of strange requests. A lady recently telephoned the A.C.U. from the outskirts of London to say that she was in a "paralytic fright" of the traffic. Another member also telephoned that he was "fed up" and tired, and required someone to drive his machine into London. The lady was at least candid.

An Irish Two-day Trial.

The forthcoming Irish Two-day Reliability Trial is an open event, and starts from Dublin on Saturday, the 31st inst. Saturday night to Monday is to be spent at Glengarriff, Co. Cork, and the trial finishes on Monday evening (August 2nd).

As the Irish End-to-end is indefinitely postponed, the organisers hope that some of the English and Scottish competitors will support the two-day run. The famous hill of Gowlane, Co. Kerry, is included in the course, also the pass of the Knockmealdown Mountains between Tipperary and Cork. A sporting trial is assured, and no trouble or interference from the country people is anticipated; on the contrary, great help and interest are manifested in every district. Full particulars are obtainable from the sec., Mr. W. Freeman, 16, Fade St., Dublin.



SILVER AND GOLD MEDAL WINNERS IN THE SCOTTISH SIX DAYS.

T. R. Fellows (James) and G. Grinton (Harley-Davidson) on Abriachan. This hill is on the north-western bank of Loch Ness, between Inverness and Drumnadrochit.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Time to Decarbonise.

(1.) What would be the result of using a chemical carbon remover in the cylinder of my 1913 Triumph? I notice that it is claimed to be satisfactory and to have no harmful results. (2.) Can I in any way clean out the silencer of my Triumph without upsetting the Bosch magneto? To my knowledge, it has not been cleaned out since the machine was delivered. (3.) My engine runs hot, and I take it, if everything else is in order, a perfectly clean silencer would be an improvement?—R.A.D.

(1.) We have had no experience with the type of preparation you mention. We do not think that it will cause any damage to the engine. (2.) It will be necessary to remove the magneto if you wish to dismantle the silencer, but you can probably clean it by removing the exhaust pipe, which is merely held by the union nut on the cylinder and the extension pipe, which is held by the hanger on the chain stays of the machine and is only a push fit in the silencer end plate. (3.) Probably the engine requires decarbonising, and also the exhaust valve may need grinding in.

Crankshaft out of Truth.

My 1913 two-stroke Sun-Villiers was recently taken down for overhauling on account of oil and petrol leakage. After being assembled again it made a knocking noise, and then stiffened owing to binding in the crank case. On taking down again it appeared to run smoothly in the two shaft channels of the crank case, but when built up it tightened again. Is it a case of the two shafts being out of line? Would slackening the crank pin nuts, correcting the alignments, and tightening up again correct matters? Is it a job an ordinary mechanic could accomplish? If it were necessary to send to the makers, should the whole cycle or just the crank case be sent?—A.R.

You should slacken the crank pin nuts and set the main shafts in line by tapping the balance weights with a light hammer. Then carefully retighten the crank pin nuts, taking care that the shafts do not move during the process. If the engine still gives trouble in this direction, it is probably due to the tapers of the crank pin being worn and not fitting well in the holes in the crank web. In this case, it would be necessary to return the engine, or, at any rate, the crankshaft and connecting rod, etc., to the makers.

Over-lubrication.

(1.) Being a novice, will you kindly advise me on the following matter? My Ruby two-stroke will fire as long as I run with it, but smokes a lot, and does not pull. Compression is poor. (2.) Should the crank case be half full of lubricating oil? I have not put much in because it smokes a lot, and I thought too much oil might be the cause. (3.) Oil runs from the exhaust, and after I have tried running it once it will fire out of the release valve at the cylinder head before I drop the lever. (4.) Am I right in thinking the piston rings a bad fit? (5.) Is there danger of catching fire? (6.) Please state timing for engine.—F.R.

(1.) The smoking is caused by over-lubrication, but the details you give are insufficient to enable us to tell you why the engine does not pull. It may be due to the ignition being too far retarded. (2.) The crank case should not be half full of lubricating oil. You do not state the method of lubrication employed on your machine. If the petroil system is used, about one pint of oil should be mixed with one gallon of petrol, but if a drip feed is fitted it should be regulated so that it delivers about thirty drops of oil per minute. (3.) This trouble again is due to over-lubrication. (4.) There is no need to replace the piston rings unless you are quite sure that they are a bad fit. As the engine has been excessively over-lubricated, it would be wise to fit a new sparking plug. (5.) There is no danger of the machine catching fire. (6.) Time the spark to occur when the piston is at the top of the stroke, the ignition control being fully retarded.

Magneto for Vertical Twin.

I have an old 12 h.p. car engine which has never been fitted for a magneto. Behind the handle starter on the main crankshaft there is a forty-tooth wheel driving the governors, and I intend to run the magneto off it. What tooth wheel should I require on the magneto, and what degree magneto should I require? The engine is a vertical twin with a two-throw crankshaft.—C.H.

You will require a two-cylinder magneto for an engine with firing intervals of 180°, and this must run at the engine speed. If you intend driving it from the forty-tooth sprocket already on the engine-shaft, you will require a similar size sprocket on the magneto-shaft. If possible, you should fit smaller sprockets.

AMONG THE FELLS OF LANCASHIRE.

Early arrivals at the East Lancashire M.C.C.'s Hill-climb described last week. During the afternoon thousands of spectators assembled to witness what proved to be a good afternoon's sport.

Worn Gear Parts.

[?] The middle gear of my 4¼ h.p. chain drive B.S.A. slips out of engagement. The control rod is properly adjusted. In testing the gears with inspection plate off, I notice that the dogs in the middle gear do not mesh fully. They will go in if pushed with a screwdriver, or some such tool, but the operating rod will not send them in properly. This dog clutch, for engaging with the middle and low gears, seems too loose on its operating fork. (1.) What can I do to correct this? (2.) What is the best way to remove the smaller chain wheel from the gear box?—W.W.

The trouble is most probably due to the selecting fork in the gear box being worn where it fits in the groove of the dog clutch. As, of course, both these parts may be worn, you will possibly have to renew them. The safest method of removing the small chain sprocket from the gear shaft is by means of a sprocket drawing tool, but if you are unable to obtain the use of one, the sprocket may be removed by levering it off the shaft, and this process will be helped by sharp blows on the end of the latter with a mallet.

A Lightweight Trouble.

[?] (1.) Whilst riding my 1919 Levis a few days ago the engine suddenly started to hesitate and then stopped. Just before stopping, however, loud explosions occurred in the crank case and the silencer. I have not been able to start the engine since, although I have decarbonised and retimed the magneto. I might say that when I opened my drain tap on the crank case liquid petrol ran out mixed with oil. (2.) My carburetter is always dripping at the jet. What mode of procedure should I take to overcome this? (3.) Should there be any side and up and down play in the piston, also any side play in the connecting rod? (4.) When I insert my finger through the sparking plug hole and feel at the piston there appears to be some movement. Should this be so? The compression is quite good. (5.) A week or two ago I had the engine entirely out of the frame and noticed that there was a small backward and forward movement in the front down tube. Do you think this is caused through the lug being loose at the top or to the steering head being loose?—J.T.H.

(1.) Unfortunately, the details you give are insufficient to enable us to tell you the cause of the stoppage and the reason which prevents the engine running. It is possible that the timing of the magneto slipped, and we suppose that you have readjusted it correctly, with the spark occurring when the piston is at the top of the stroke, the control being fully retarded. (2.) If your carburetter is an Amac, a leakage at the base of the jet is probably due to the coned seating of the jet platform being damaged, when it no longer makes a petrol-tight joint. The carburetter may also be flooding slightly, and this you can cure by lowering the petrol level. The easiest method of doing this is by placing a light washer on the top of the float underneath the split-pin on the needle. (3.) Side play in the connecting rod bearings is of no importance, but there should not be any up and down play. (4.) The piston should not move sideways appreciably when it is in the cylinder. (5.) The movement in the front down tube of the frame may be merely the natural spring of the tube. You should be able to tell, however, whether it is loose in the head lug or not if you inspect it closely. It would perhaps be advisable to remove the enamel from the region of the lug if you are at all uneasy about it, as the results might be serious if the tube breaks away when the machine is travelling at any speed.

IMPORTANT DATES.

Thurs., July 15th—
Essex M.C. Joint Open Speed Trials, Westcliff-on Sea.
Sat., July 17th—

THE SIMPLE SOLO SINGLE.

A sporting entrant, Robert Carfrae, who rode a single-geared Triumph in the Scottish Six Days Trial.

Cancelling an Order.

[?] I should be pleased if you could put me right on the following point: Last June I advertised for sale in *The Motor Cycle* the delivery of a new sidecar outfit in about three weeks' time, as the agents thought they could deliver on or about July, my order being placed last May. I received a reply and agreed to let the machine go at list price when it arrived; the buyer to agree to the same terms as regards the rise in price, etc., as laid down by the makers. I have now received from him a letter demanding the return of £10 deposit paid. (I had paid £10 deposit to the makers.) Am I compelled to return to him the amount, or must he lose this as he has cancelled the order? If I must pay him, can I claim my deposit from the makers?—C.H.

If the buyer paid a deposit such payment constitutes a contract to complete the purchase, and you can insist upon this being carried out. In the same way, your deposit of £10 to the manufacturers also constitutes a contract to purchase the machine, and, unless you can obtain the return of your deposit, there is no reason why you should be compelled to cancel the agreement with the person to whom you have sold the machine.

PRECISION

Ramont SPORTS COAT

MADE TO MEASURE
30/-

Great Offer to Motor Cyclists

Sports Coats direct from makers at half shop price.

Only by dealing direct with the actual makers can a coat similar to the "RAMONT" be bought for 30/-. Our only expense, apart from the manufacture, is the cost of this advertisement. You deal direct with the manufacturer, and, by so doing, cut out the agents' and middlemen's profits.

The "RAMONT" is a sound, serviceable Sports Coat, cut on the smartest of fashion lines. It is made up in Sand Cloths, Yorkshire Tweeds, Herring-bone Tweeds, Donegals, etc., in Brown, Grey, and Heather mixtures, and is ideal for motoring or for wear at outdoor functions. The smart, clinging appearance (for the "RAMONT" is made to your own measurements) make it equal to any coat at double the price. Prices from 30/- to 50/-, according to the quality of tweeds. TROUSERS can also be made of the same material as coat if required, making the "RAMONT" SPORTS COAT into a cheap Summer suit.

30/- NOT £3.

SOLD WITH "MONEY-BACK" GUARANTEE.

Every Coat is sold on the understanding that if you are not satisfied with it we refund your money in full.

SEND NO MONEY—SEND FOR PATTERNS.

Send p.c. for patterns of "RAMONT" Tweeds Booklet and order form. All goods despatched within seven days of receipt of order.

Pleated back, with 3 pockets.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed ~~& Co.~~ Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

DEEDS NOT WORDS.

NORFOLK, May 20th, 1920.

Dear Sir,
I am thinking of getting another Douglas (I had one from you in early 1919) and would be glad if you will send me full particulars of the 2¾ models. I notice in your advertisement in "The Motor Cycle" "Models W. and W.20" at £100 and £105. This is not very enlightening so could you send me photos, catalogues, etc. to illustrate differences between the two models. I SUPPOSE YOUR STATEMENTS AS REGARDS DELIVERY ARE QUITE DEFINITE. IT HAS ALWAYS BEEN A PLEASURE TO DEAL WITH YOUR FIRM. SO I SUPPOSE THEY ARE.
Yours truly,
(Sd.) R.I

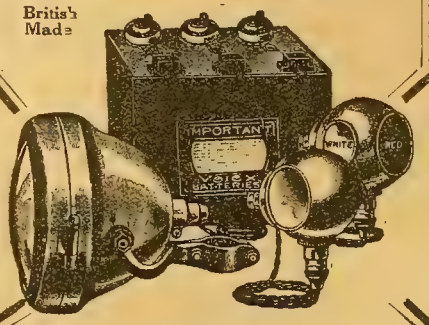
"Volex"

DRY BATTERY Lighting Outfit for the MOTOR CYCLE & SIDECAR.

British Made



For over ten years they have been in use for this service, and of recent years, in consequence of their dependency, the demand is constantly increasing. Dynamo Lighting Sets with Accumulators require careful attention, and, owing to complications, have a tendency to go out of order. Accumulators, if not regularly charged, whether in use or not, sulphate and become useless. The Batteries, which are fitted in a metal container with switchboard mounted on top, lie conveniently in the bottom of the sidecar, and with ordinary care will last, when in use, from 6 months to 18 months without renewal. If one of the batteries becomes exhausted it can be replaced independently of the others at but little cost. Comprising Superba Head Lamp (6in. front) Bait or Torpedo Pattern Side Lamp, Ball Tail Lamp, "Volex" Aero Dry Batteries in special metal container with switchboard mounted on top, complete with waterproof conducting cords and spare set of bulbs. As illustrated. No. 3 C/49. **£9 15 0**

Also supplied with the "Superba de Luxe" Head Lamp (9in. front) **£10 15 0**

Twopence a Mile.

"IT is an ill wind that blows no one any good," and the proposed increase in train fares should encourage the sale of motor cycles to a marked degree. There is an enormous number of people who live from ten to twenty miles from their work, and whose means are such that the extra halfpenny a mile will make an appreciable difference to them. Under these circumstances, some alternative form of locomotion becomes desirable, and what more suitable can be found than the motor cycle?

A lightweight machine can be run for a considerably smaller sum than even the present railway rate. Here is the opportunity for the all-weather lightweight. The business man requires no great speed. A light machine should take him to his office door in approximately the same time as a suburban train plus the usual 'bus, tube, or walk; but he must arrive in a presentable condition, and it is essential that his machine shall be more or less "foolproof" as well as cheap to run. There are already machines on the market which satisfy all necessary requirements, but there are still many which are incomplete as regards mudguarding, but satisfactory in other respects. It will be interesting to watch the progressive firms who seize the opportunity which is now presented to them of modifying existing models in order to catch a large and growing market. In this connection, the single-cylinder dual-purpose machine will be found very suitable as a general utility mount for the masses. In the meanwhile, the sales of the more suitable lightweights and medium-powered sidecar outfits should increase steadily, and many prospective purchasers who have been hovering on the brink will be converted to the motor cycle, and will find the new mode of travel will provide them with better health and a sense of freedom which those who are tied to trains and a timetable can never experience.

Imports and Exports.

WHILE everyone is concerned by the increased cost of living, the maximum effort does not appear to be made to increase production in the manufacturing world in order to swell our exports. Our imports are still considerably more than our exports, and while that state of affairs exists we cannot reasonably expect a reduction in the cost of living. This is a question affecting everyone, and, although only indirectly a motor cyclist's matter, we are constrained to urge a general speeding up from a national point of view, and also because the motor cycle can only come fully into its own when national prosperity is as real as it is, at present, only apparent. An effort to increase exports by everyone concerned is the only way by which the present rate of exchange can be improved. Then we shall secure a reduction in cost of living.

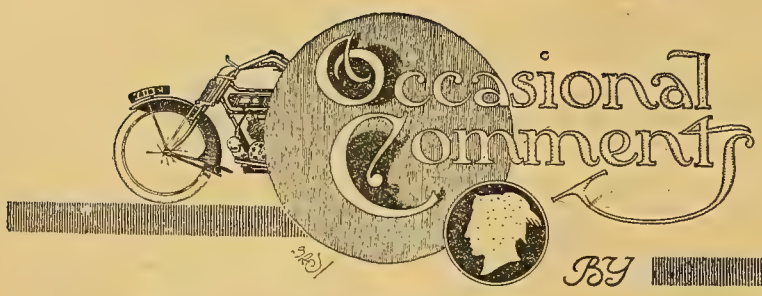
International Competitions.

ALTHOUGH the T.T. and the A.C.U. Six Days Trial are international contests, there has been very little of an international nature about these events since the war. Even the International Six Days starting this week-end has not attracted a really representative British entry. The Anglo-Dutch trial in August, therefore, may be counted as the first truly international event in the motor cycle world since the signing of the Armistice, and as such will attract national interest.

In this trial a picked team of British riders rides against a picked team of Dutch motor cyclists. The event, therefore, can be likened to such contests as that for the America Cup in the yachting world, and the Olympic Games at Antwerp.

The future may produce competitions in the motor cycle world between picked riders of Great Britain, Ireland, U.S.A., Holland, France, Belgium, and the Overseas Dominions.

An index to the advertisements in this issue will be found on the page facing the back cover.



Exchanging Saddle Springs.

IT may be news to some readers that the saddle makers stock saddle springs to suit different weights. Saddles — like sidecars — should be sprung to suit the person whom they carry. So far as my experience goes, the average saddle spring is rather on the stiff side, and is calculated to suit a twelve-stone man. The makers' fee for exchanging a set of springs is usually no more than a shilling or two, and is worth paying when a machine is bought for keeps.

Chain Drive on Spring Frames.

IT may not have occurred to all users of spring frames that the chain tension varies a little according as the saddle is occupied or empty, because the centre of the front sprocket does not coincide with the centre of the pivot of the rear springs. Manufacturers are apt to gloss over the point for obvious reasons, but the difference in tension is sometimes sufficient to be perceptible. Little or no practical inconvenience results if the owner is careful to make his chain adjustments with a friend of approximately his own weight seated on the saddle.

Night-riding Restrictions.

IT is interesting to notice that the problems of night riding are now being tackled from both ends. In connection with the medical examination, mooted as a preliminary to the issue of driving licences, the oculists have specified a "minimum vision," and Sir Eric Geddes will shortly define a "maximum light." This looks as if the policy were to limit the use of the roads after dark to people with hawk-like eyes travelling in a pallid gloom, and reminds one irresistibly of Plato's description of the infernal regions as a cellar peopled by shadows. The trend of these proposals is full of danger. If motoring is to be regarded either as a dangerous hobby confined to the unco' rich (like hunting), or as a utilitarian method of transport (like the railways), severe restrictions might be justifiable. But motoring actually fulfils both the above definitions, and is also a great deal bigger than either of them. It is the favourite hobby of the middle classes and of the more prosperous artisans. In the past our road law has been framed and administered, on the whole, in the interests of liberty. Blind folk are permitted to walk. Deaf persons are permitted to cycle. Uneducated flappers are permitted to wheel prams with twins in them. Little toddlers are permitted to play pegtop. Elderly females without powers of decision are permitted to ferry great armfuls of parcels about the public streets. The safety of road users has been mainly entrusted to the commonsense and sympathy of other road users. The system has worked well. There are symptoms of change. The mantle of Dora appears to have fallen on our bureaucrats. It would be folly to allow bleareyed octogenarians to drive three-litre Bentley cars with 100,000 c.p. head lamps. But it will be oppression if our lamps are dimmed down to the likeness of 1in. paraffin wicks, and night riding is then confined to men who can pass the sight tests for an R.A.F. pilot. Undoubtedly the price of liberty is eternal vigilance.

Toolbag Fastenings.

AT the risk of being taken for a scorcher, I must plead guilty to having lost the entire contents of three pannier bags in the last nine months. In each case the bag was properly fastened, in the sense that its spring catch was secured, but the bags were not locked, since I find that the flimsy keys usually supplied are apt to buckle when a little inevitable dust has entered the lock. In no case did I recover any of the lost items. (To anticipate several gleeful assailants, I freely admit that, if I rode a dead silent machine, I should have heard the tools clatter on the road.) Can it be wondered that I lament the disappearance of the old strap and buckle fasteners? They may be more tiresome for cold fingers to operate than any form of press catch, but when they are once fastened they stay fastened. Existing snap catches have two main defects. The first is that few of them are absolutely vibration-proof. The second is that the catch is mounted on a panel of flexible leather, and that a catch which is perfect when the bag is new often shows less security when months of overfilling have strained the shape of the pannier.

The Two-wheeled Car.

THE motor cycling correspondent of *The Times* is a fearless, outspoken person, and his lucubrations (*what* a lovely word!) are always worth reading. The other day he was coquetting with the notion of a two-wheeled car on the lines of the canoe type of bicycle which A. V. Roe begot before he switched off into aviation. He considered that the great weight consequent upon a very long wheelbase was the chief snag, especially because weight increase spells cost increase. I don't quite see why a two-wheeled car should necessarily be very lengthy. Of course, if the occupant is to be recumbent between the wheels, *à la* sports car, the beastie would amass a wheelbase of about 12ft., and be a peach to manage over grease. But if a two-wheeled car is desirable, it may be possible to wangle it upwards instead of lengthways; the charm of the idea is full weather protection plus the chance of wearing ordinary clothes. If a windscreen is used, the wheelbase need not be long, and the machine would not be more top-heavy than current patterns. I think the real difficulty is to

Occasional Comments.—

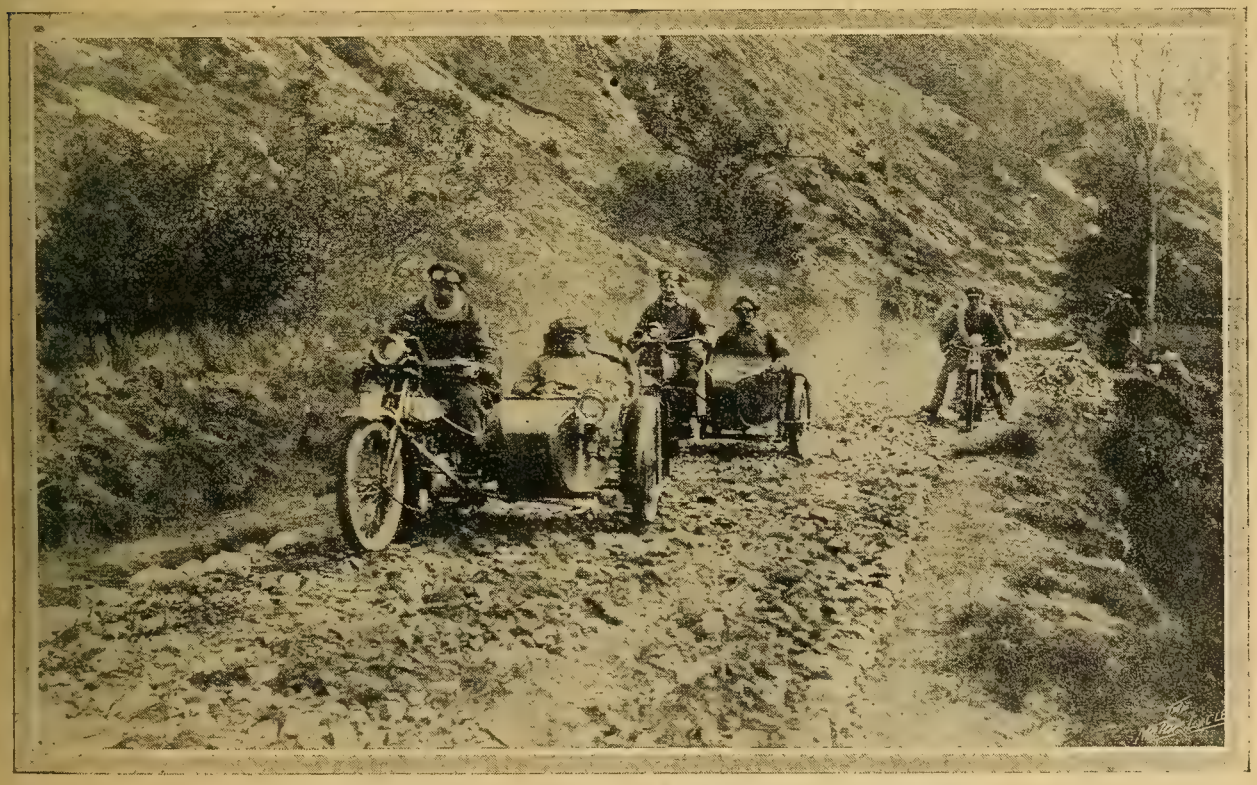
devise a presentable body which shall be both light and durable. During the war some of us talked a lot of hot air about laced fabric over skeleton spreaders, *à la* aeroplane; but the appearance of either laced linen or plywood after one hundred hours' flying is worse than that of my 1920 leg overalls, which are already ragged, charred, and oily. On the other hand, my experience of disc wheels suggests that the side wind might become a horrid fellow if the side view of the machine resembled a sail, and perhaps this justifies *The Times* expert in taking a long, low profile for granted. Anyway, if the mono track car comes along, I for one will not ride it in a howling gale across Dartmoor.

Motorcycleopolis.

A COLLEAGUE of mine on *The Autocar* staff has had a brainwave which, like all real brainwaves, is attractive, if its practicability is uncertain. Dealing with the vexed question of the car shows, he points out that the 1919 Olympia was most unsatisfactory, that and all proposals yet promulgated for the improvement of the 1920 Show have been futile. The root defect was that more people wanted to see the Show than any known building can accommodate, so long as the exhibition is limited to a single week. Actually, the number of people who want to see the Show far exceeds the attendance, but thousands of provincial and oversea motorists cannot be in London during Show week, though they visit town at other times. Accordingly, he proposes that all the London organisations of the car factories should be concentrated in a single suburb, preferably under one roof, which would be tantamount to a permanent show, and prove more economical and more efficient than the present annual week. The cost of such a giant motor hall would be recouped in a few years by the money saved through the suspension of the annual show in a hired building; and a special Demonstration Week would still be held annually in November. This suggestion reminds me of the days when the London showrooms of the cycle factories were all massed in Holborn Viaduct. There is already a tendency to clump motor cycle agencies together, *e.g.*, in Great Portland Street. The metropolitan organisations of the motor cycle manufacturers occupy comparatively little space, and need not be massed in or near the West End; in fact, such a location as Willesden would suit them better, for visitors by road and customers who want a trial run often dislike central London traffic intensely. My colleague's suggestion seems even more applicable to the motor cycle than to cars.

C. B. Franklin on the Warpath.

A BREEZY letter from Russell Coes, the Indian exponent, advises me to try the old method of finding air leaks by squirting petrol on the induction joints whilst the engine is running, and noticing whether the spirit is drawn in and affects the beat. Coes is very gleeful about the Indian attacks on the new Harley-Davidson records, especially Gene Walker's 500 c.c. mile at the gait of 87.8 m.p.h. Coes says that C. B. Franklin should have the credit for making all the new Indian records at Daytona possible.



DIFFICULT GOING IN THE 1920 SCOTTISH SIX DAYS TRIAL.

Road repairs are in progress in many parts of the country. J. S. Holroyd (8 Blackburne sc.), A. F. Downie (6 A.J.S sc.), and some solo riders crossing a stretch of unrolled metal.

Over 70 m.p.h. on Westcliff Esplanade.

Fine Weather favours the Essex and Southend Club's Speed Trial. Some Sensational Speeds. Fastest Motor Cycle and Fastest Car Tie.

Start of the 750 c.c. sidecar class. C. H. Smith (4 Triumph), G. E. Stobart (5-6 James), who won this and several other events, and E. Kickham (3½ Douglas).

AN excellent meeting! Such was the general opinion of the many thousands of spectators who witnessed the very successful meeting held at Westcliff-on-Sea last Thursday. The weather was ideal, and remarkable speeds were attained by small and large machines alike.

First place in eighteen of the thirty motor cycle events was secured by five machines, including a 5-6 h.p. James sidecar ridden by G. E. Stobart. This machine and rider carried off no fewer than six first places. Good performances were also put up by E. Porter (3 A.B.C.), who won four events.

Close Finishes.

Fastest time of the day was made by H. R. Harveyson (7 Indian), who attained a speed of 75.57 m.p.h. in the "unlimited" event. In this race, C. E. Baragwanath, on his fearsome looking 8 h.p. Zenith, also put up a good show, finishing second. His time was but $\frac{1}{5}$ of a second longer than the winner.

The most sensational race of the day was undoubtedly the match between the motor cycle and car which had created the highest speed in the preceding events. Harveyson, of course, represented the motor cyclists, and he was pitted against L. V. Cozens (24 Sunbeam).

Harveyson was seen rounding the corner, quarter of the distance from the finish, at a terrific speed, practically neck for neck with the Sunbeam, and passed the finishing line abreast of the car. A somewhat heated discussion among spectators then ensued as to the winning machine. The speed, which was 73.58 m.p.h., was so great that it was impossible to venture a suggestion, and later it was officially announced as a dead heat.

F. W. Applebee, on his little Levis, finished second in class two in which were entered eight machines of a greater capacity. Le Vack's Duzmo, which now bears a question mark, figured in three races, capturing the premier place in each, whilst E. Kickham, who rode both a 2¾ and a 3½ Douglas, secured two firsts.

One motor scooter event was provided, the winner piloting a 1½ h.p. Bunty at a speed of 29.91 m.p.h.

A factor which possibly led to the high speeds of the larger machines was an upwind blowing at approximately 15 to 20 m.p.h.

The officials of the Southend A.C. and the Essex M.C., the joint organisers, must be congratulated on the successful organisation of the meeting. Special praise is due to Messrs. A. V. Ebblewhite, T. D. Dutton, and A. G. Reynolds, the official timekeepers, who so speedily furnished the anxious spectators with the results at the conclusion of each race, and supplied members of the press with the complete time results within ten minutes of the last event.

Results.

CLASS 1. Motor Scooters (S.S.).—1, S. C. Marshall (1½ Bunty); 2, G. A. Bray (1½ G.A.B.). Time, 1m. 14⅘s. Speed, 29.91 m.p.h.

CLASS 2. Touring Machines not Exceeding 350 c.c. (S.S.). 1, J. F. Lidstone (2¼ James); 2, F. W. Applebee (2¼ Levis); 3, F. Thorpe (2¾ Douglas). Time, 51⅘s. Speed, 43.52 m.p.h.

CLASS 3. Touring Machines not Exceeding 500 c.c. (S.S.). 1, H. le Vack (3½ Duzmo); 2, G. Strange (3½ James); 3, L. H. Herrtage (3½ Rudge). Time, 37⅖s. Speed, 59.49 m.p.h.

CLASS 4. Touring Machines not Exceeding 750 c.c. (S.S.). 1, H. le Vack (3½ Duzmo); 2, Capt. R Charlesworth (5 Zenith); 3, E. L. Gay (4 Triumph). Time, 36⅖s. Speed, 61.79 m.p.h.

CLASS 5. Touring Machines of Unlimited Capacity (S.S.). 1, G. Strange (3½ James); 2, E. L. Gay (4 Triumph). Time, 40⅖s. Speed, 55.10 m.p.h.

CLASS 7. Touring Sidecars not Exceeding 500 c.c. (S.S.). 1, E. Porter (3 A.B.C. sc.). Time, 58⅘s. Speed, 38.17 m.p.h.

CLASS 8. Sidecar Touring Machines not Exceeding 750 c.c. (S.S.). 1, G. E. Stobart (5-6 James); 2, E. Porter (3 A.B.C.); 3, Capt. R. Charlesworth (5 Zenith). Time, 46s. Speed, 48.63 m.p.h.

CLASS 9. Touring Sidecars, Unlimited Capacity (S.S.).—1, G. E. Stobart (5-6 James sc.); 2, W. J. Barker (8 Henderson sc.); 3, E. Porter (3 A.B.C. sc.). Time, 46⅕s. Speed, 48.42 m.p.h.

CLASS 10. Solo Machines not Exceeding 350 c.c. (S.S.).—1, E. Kickham (2¾ Douglas); 2, J. F. Lidstone (2¼ James); 3, E. B. Ware (2¾ N.U.T.). Time, 42⅘s. Speed, 53.01 m.p.h.

CLASS 11. Solo Machines not Exceeding 500 c.c. (S.S.).—1, G. Strange (3½ James); 2, H. le Vack (3½ Duzmo); 3, F. J. Boshier-Jones (3 A.B.C.). Time, 41⅕s. Speed, 54.03 m.p.h.

CLASS 12. Solo Machines not Exceeding 750 c.c. (S.S.).—1, F. J. Boshier-Jones (3 A.B.C.); 2, E. Porter (3 A.B.C.); 3, H. le Vack (3½ Duzmo). Time, 38⅗s. Speed, 57.65 m.p.h.

CLASS 13. Solo Machines of Unlimited Capacity (S.S.).—1, H. R. Harveyson (7-9 Indian); 2, C. E. Baragwanath (8 Zenith); 3, H. Boshier-Jones (3 A.B.C.). Time, 39⅗s. Speed, 56.2 m.p.h.

CLASS 15. Sidecar Machines not Exceeding 500 c.c. (S.S.).—1, E. Kickham (3½ Douglas). Time, 1m. 13s. Speed, 30.64 m.p.h.

CLASS 16. Sidecar Machines not Exceeding 750 c.c. (S.S.).—1, G. E. Stobart (5-6 James sc.); 2, E. Kickham (3½ Douglas sc.); 3, C. H. Smith (4 Triumph sc.). Time 46⅕s. Speed, 47.80 m.p.h.

CLASS 17. Sidecars, Unlimited Capacity (S.S.).—1, G. E. Baragwanath (8 Zenith sc.); 2, W. J. Barker (8 Henderson sc.); 3, H. R. Harveyson (7 Indian sc.). Time, 44⅗s. Speed, 49.93 m.p.h.

CLASS 18. Touring Machines not Exceeding 350 c.c. (F.S.).—1, F. Thorpe (2¾ Douglas); 2, F. J. Lidstone (2¼ James); 3, C. H. Smith (2¾ Douglas). Time, 40⅗s. Speed, 55.10 m.p.h.

CLASS 19. Touring Machines not Exceeding 500 c.c. (F.S.).—1, H. le Vack (3½ Duzmo); 2, G. Strange (3½ James); 3, N. H. Herrtage (3½ Rudge). Time, 32⅕s. Speed, 69.47 m.p.h.

CLASS 20. Touring Machines not Exceeding 750 c.c. (F.S.).—1, H. le Vack (3½ Duzmo); 2, E. L. Gay (4 Triumph); 3, W. R. Bailey (3 A.B.C.). Time, 32⅗s. Speed, 69.04 m.p.h.

CLASS 21. Touring Machines, Unlimited (F.S.).—1, Capt. O. M. Baldwin (8 Matchless); 2, G. Strange (3½ James).

CLASS 23. Touring Sidecars not Exceeding 500 c.c. (F.S.).—E. Porter (3 A.B.C sc.). Time, 1m. 2⅕s. Speed, 35.85 m.p.h.

CLASS 24. Touring Sidecars not Exceeding 750 c.c. (F.S.).—1, G. E. Stobart (5-6 James sc.); 2, E. Porter (3 A.B.C. sc.). Time, 39⅗s. Speed, 56.49 m.p.h.

CLASS 25. Touring Sidecars, Unlimited Capacity (F.S.). 1, G. E. Stobart (5-6 James sc.); 2,

ver 70 m.p.h. on Westcliff Esplanade.—

7. J. Barker (8 Henderson sc.); 3, E. Porter 3 A.B.C. sc.). Time, 39⅘s. Speed, 56.78 m.p.h.

CLASS 26. Solo Machines not Exceeding 50 c.c. (F.S.).—1, E. Kickham (2¾ Douglas); 2, H. Alliott (2¾ Douglas). Time, 35⅗s. Speed, 3.19 m.p.h.

CLASS 27. Solo Machines not Exceeding 00 c.c. (F.S.).—1, E. Porter (3 A.B.C.); 2, H. Vack (3½ Duzmo); 3, F. J. Boshier-Jones 3 A.B.C.). Time, 31⅗s. Speed, 70.79 m.p.h.

CLASS 28. Solo Machines not Exceeding 780 c.c. (F.S.).—1, E. Porter (3 A.B.C.); 2, F. J. Boshier-Jones (3 A.B.C.); 3, H. le Vack (3½ Duzmo). Time, 31⅗s. Speed, 71.24 m.p.h.

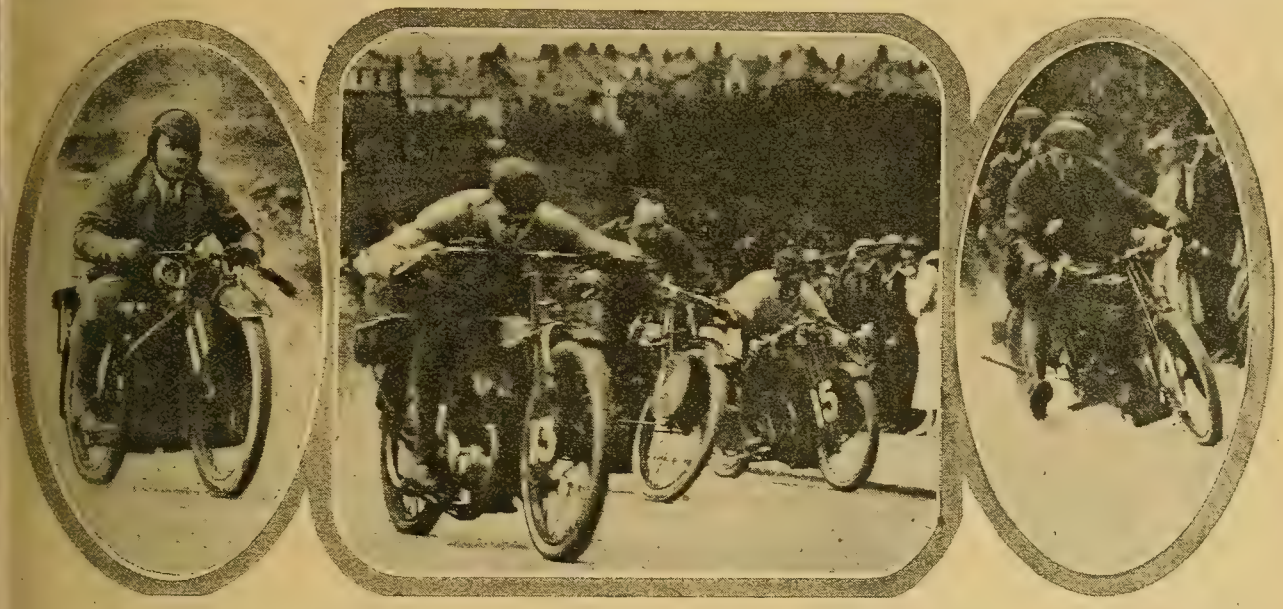
CLASS 29. Solo Machines, Unlimited Capacity (F.S.).—1, H. R. Harveyson (7 Indian); 2, C. E. Baragwanath (8 Zenith); 3, Capt. O. M. Baldwin (8 Matchless). Time, 29⅗s. Speed, 75.57 m.p.h.

CLASS 32. Sidecar Machines not Exceeding 750 c.c. (F.S.).—1, G. E. Stobart (5-6 James sc.); 2, D. H. Davidson (4 Harley-Davidson sc.); 3, E. Kickham (3½ Douglas sc.). Time, 39s. Speed, 57.36 m.p.h.

CLASS 33. Sidecar Machines of Unlimited Capacity (F.S.).—1, C. E. Baragwanath (8 Zenith sc.); 2, W. C. Veasey (8 Henderson sc.); 3, H. R. Harveyson (7 Indian sc.). Time, 36⅗s. Speed, 60.78 m.p.h.

CLASS 47. Match, Motor Car *v.* Motor Cycle.—Dead heat: L. V. Cozens (24 Sunbeam), H. R. Harveyson (7 Indian). Time, 30⅗s. Speed, 73.58 m.p.h.

*(F.S.) and (S.S.) mean flying or standing start.



Some impressions of men and machines a few yards from the starting line. No. 11, W. R. Bailey (3 A.B.C.), is steady. No. 13, G. E Stobart (5-6 James), in his characteristic style with elbows out. No. 14, H. le Vack, on the Duzmo, has not yet got into his stride. No. 15, J. Day (3½ Sunbeam), is dangerously near the kerb. No. 3, the veteran F. W. Applebee (2¼ Levis), starts off with a skid

AN ECHO OF THE TOURIST TROPHY.

THE riders of Sunbeam Tourist Trophy machines were assembled on the evening of July 15th at the Victoria Hotel, Wolverhampton. A dinner in their honour had been arranged by Messrs. John Marston Ltd., and the gathering included the directorate and staff chiefly concerned in the production of the T.T. sunbeams. With the exception of R. Rice, the reserve rider, who broke his arm during practice, all the riders were present. Mr. C. Marston was in the chair, supported by Mr. A. S. Bowers as vice-chair, and a thoroughly enjoyable evening was provided. Following the toast of "The King," given by Mr. C. Marston, Mr. Bowers rose to propose "The T.T. Riders." He congratulated T. C. de la Hay on his win, Reg. Brown (third) on being the first amateur to finish, F. C. Townsend on a plucky ride, and Eric Williams on his fortunate escape when he fell through no fault of his own. George Dance, of course, came in for his share of felicitations in connection with his wonderful record lap. In his reply de la Hay expressed for himself and the other riders their cordial feelings towards the firm. The Vice-chairman then presented a Sunbeam gold medal to each of the riders, also to the designer, Mr. J. E. Greenwood, and Mr. T. Rutherford, a well known Sunbeam amateur rider who acted as an official during the race. In reply to Mr. Marston's proposal of "The Press," Major Axford spoke very ably and was followed by Mr. H. D. Teage (*The Motor Cycle*). Among other speakers may be mentioned Messrs. Alec Ross, J. E. Greenwood, W. Newill, and T. Rutherford. The toasts were interspersed by an excellent musical programme provided by Major Axford, Mr. J. E. Greenwood, Mr. W. Morgan, and Mr. T. Green.

ROAD BUILDING BY COMPRESSED AIR.

THERE is as much engineering in building a good road as in building a motor cycle. By building roads in concrete they last practically for all time. Every mile of concrete road that is built represents a big saving in petrol. Just how greatly concrete helps in this phase of conservation may be gathered from the following figures based on actual tests made with motor lorries:

Tractive resistance per ton of weight: Concrete road, 30 lb.; gravel, 82 lb.; dirt, 99 lb.

Up to the present the methods employed in handling and carrying concrete have been, in most cases, exceedingly crude. Very few attempts have been made to employ machinery for this purpose, or to evolve new methods for the saving of time. It is becoming a truism to say that the development of compressed air and its employment for all sorts of purposes are increasing by leaps and bounds. As some confirmation of this, we may say that we have recently heard of a concrete cannon that has been invented for the conveyance and distribution of concrete by means of compressed air, and which is particularly applicable to roads.

The concrete cannon is a modern, improved, efficient application of an old principle. It operates by the direct positive displacement of a batch of concrete by air under pressure. The only essentials to successful operation are adequate supplies of concrete and compressed air. It pumps concrete in any quantity, to any distance and height. It consists of a reservoir (mounted on a portable truck with road wheels) with a valve arrangement controlling the admission and discharge of concrete and compressed air. An air pipe from a portable compressor (which may be driven by steam, oil, or electricity) and a hose pipe for the delivery of concrete, are the only connections.

In operation, the reservoir is filled with concrete, from the mixer, when compressed air is admitted, and this forces the concrete out to the place of deposit arranged for. When the reservoir is empty the air is automatically released.

The proprietors of the device, The British Compressed Air Building Company, have temporary offices at 51, Thurlow Park Road, West Dulwich, S.E.21.

The Scottish "Six Days" from within.

by H. Mortimer Batten.

A Competitor records his Impressions of a Strenuous Week.

EVERY competitor hates the first day of a Six Days Trial, especially the Scottish Six Days, which kicks off with that notorious fly-crawl, Amulree Hill. There is a special horror attached to the project of failing on the first hill of the first day, and my initial noteworthy impression of the Trial was that of a group of competitors, who, partly owing to the chill of the early Scottish morn, and partly on account of the close proximity of the first hill, were quivering like so many jellies—leather-skinned, wind-hardened jellies—while they paused to adjust transmissions or to remove some haunting terror by dint of hammer or spanner.

The Introductory Hill.

Ahead of us, looming through the cloud wreaths, was Amulree, a straight pull of close upon a mile preceding the treacherous S bends, then with its final stretch appearing almost perpendicular till it vanished into the deluges of the upper heavens.

Personally, I do not believe in this pausing to contemplate misfortune. Modern engines are about at their best after thirty miles of steady pulling, and by pausing one merely permits the carburetter to absorb heat, so that one may find one's carburation a trifle tricky when the old familiar setting of the levers is most desired. Again, the two minutes lost here and there often lead to nervousness towards the end of the check, and a resultant blind in the last mile or so; and these periodical blinds make all the difference between a loose machine and a sound one when trouble falls on about the sixth day, and the real necessity for blinding comes. Far better to "saw wood" steadily, as the French say, and I must state, in justice to the new P. and M., that, though every climb was made with a hot engine, often succeeded by several miles of low gear work, there was in no single instance any indication of overheating when, finally, the big step into "top" was made.

Single-gear Sportsmen.

A day-to-day report of the Trial has already appeared in *The Motor Cycle*, so in the following I propose to give merely the outstanding impressions of a competitor. Foremost among these are the repeated visions of Robert Carfrae, of the single-gear brigade, shedding superfluous garments at the foot of every observed hill, turning inner tubes about his neck, winding belts about his middle, but always well ahead of time and ready to push a tram over. Then there was Campbell McGregor, to whom these Trials owe so much, another single-gear sportsman, who rode a good machine, and rode it well, but into whom the puncture fiend had firmly set his teeth. Generally we saw McGregor at the side of the road in the attitude of a Rugby half waiting for the ball, while rain streamed off his hat on to the carefully solutioned patch, and gathered in a miniature loch about his feet. Foremost among all the impressions was the rain itself, and on the second day the Highlands surpassed themselves in their own supreme art from Inverness to John-o'-Groat's and back to Thurso.

We left Inverness at 8 a.m., and it deluged unceasingly till six in the evening. We were then at Thurso, and the trip to John-o'-Groat's and back seemed an appalling waste of time and energy. Everyone had

Reminiscences of the 1920 Scottish Trials.

SCENES AND INCIDENTS IN THE RECENTLY CONCLUDED 1,000 MILE TEST IN THE HIGHLANDS.

(1) Once dreaded as one of the worst hills in Scotland, Amulree has not lost its terrors to riders of modern machines. Jesse Baker (3¾ Scott) taking the second hairpin on the first day of the trial. (2) F. J. Hutchinson (7-9 Indian sidecar) on Dunbeath Hill, one of the unobserved climbs. (3) Farthest north. E. A. Colliver (4 Indian Scout) and W. Westwood (Triumph) in the control at Thurso (4) Near Wick R. C. McCrae (7-9 Harley-Davidson sc.) and H. F. Barge (Morgan). (5) Feeding time. Machines "parked" during a luncheon control at Lairg. (6) L. Newey (4½ Ariel) on the moors near Wick. (7) In the Sma' Glen. W. Westwood (Triumph) and E. W. Choldcroft (4 A.J.S.)

The Scottish Six Days from Within.—

visions of hot drinks and warm fires. Nothing doing. Away we went to the far northern point, and now the sun condescended to shine, and life took on a new aspect. By white-walled cottages and fields of mustard we hurtled, each cottage with its knock-kneed horse and its village idiot in the way of a rooster determined to commit suicide—away to the dreaming little "land's end," which most people picture as standing, isolated and grand, alone on a rugged cape, but which, in reality, might be any spot on the coast of Norfolk.

A Formidable Stretch.

I have omitted, however, to mention the delightful little hotel at Lairg where we took lunch that day—I think the best lunch we had, and, as usual, the cheapest. The salmon was straight out of the river, and the mutton straight from the moor. Och, mon, after lunch we ordered something to keep us warm. It was brought in a tumbler, a double dose and ordinary price—the choicest pre-war stuff at that.

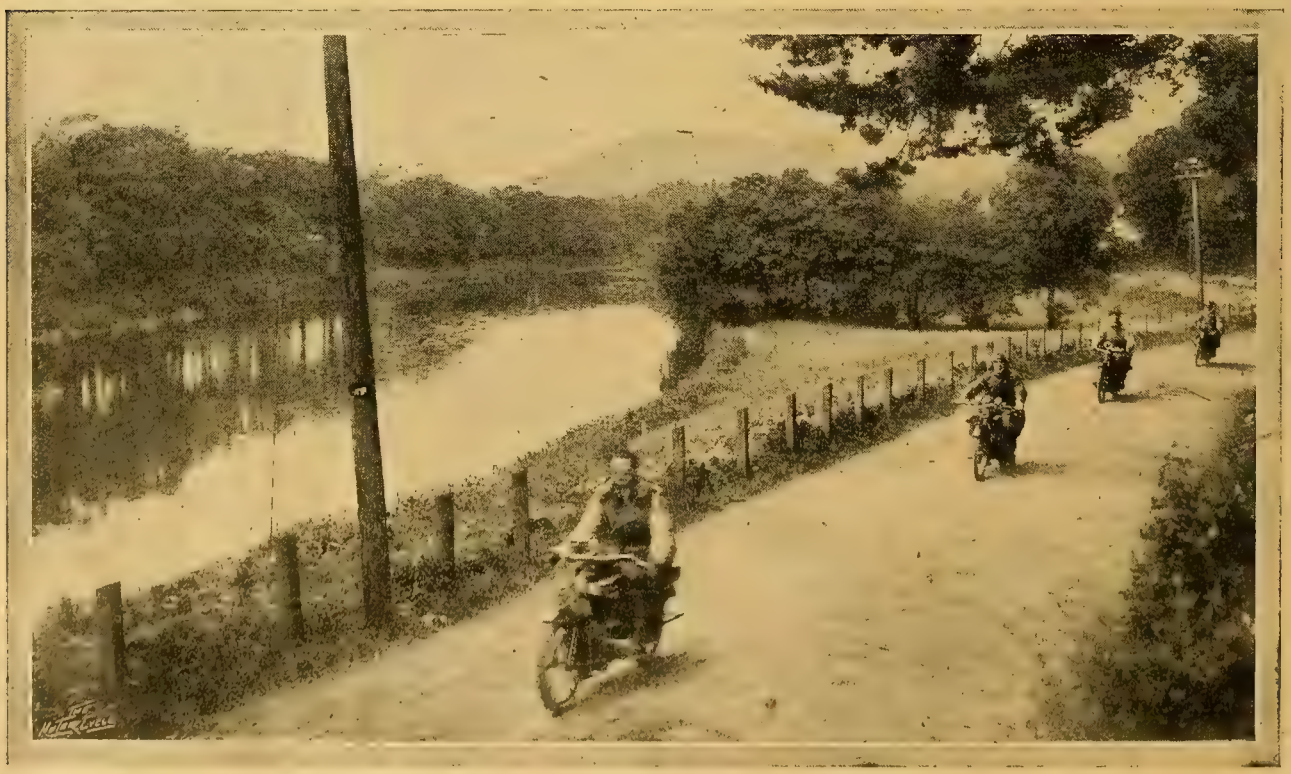
The road following consists of a series of ridges, each exactly 2in. wide. You select your ridge, and tight-rope along it till it terminates in a shell-hole. Also there are corners, so mild and gentle-looking as you approach; but these corners continue and become sharper till you find yourself ricochetting over the ruts into the rushes. This ceased at length. We were skirting a loch—still pouring in solid sheets. One obtained visions of fairy groves of silver birch, with beds of flowering "flags" here and there. The corners became worse, and real grease hampered us now. Someone overshot, and was found seated serenely among the iris while his machine reclined at the loch margin. He said he was all right, anyway, and "Good old Scotland." He had been taking advantage of the one sunny spot in a sunless day!

Another rider shot by me at about 47 m.p.h. over the ruts and shell holes. He had one finger on the bars, and he turned right round in the saddle and grinned at me—a silly, idiotic grin, considering the roads and the weather, considering our boots were full of water, and a burn following the trend of our backbones. He, too, had been guarding against chill!

Rain and more rain. Colliver was my riding mate, and all the week we stuck together, closer than brothers, exchanging dust and occasional comments. Other riders hurtled by in clouds of brown spray. Many overshot corners, not a few blued their engines or had tyre troubles. Often we saw Hugh Gibson, who was truly one of the heroes of the Trial, surmounting insurmountable obstacles, never unduly early, never late. The little Clyno possessed an extraordinarily vicious bark, and was a marvel of power and speed. Naturally, the early numbers saw little of the late. They belonged to another world, and only on the sixth day did the writer make their acquaintance. Then, alas, he saw too much of those late birds, and roused their ire on every check by passing and repassing!

An Historic Run.

The fourth day was unquestionably the most historic. Through the morning the weather was intermittently fine, and the scenery down Glenelg incomparably grand. Mam Ratachan was tackled just before lunch, and a more remarkable hill could not be

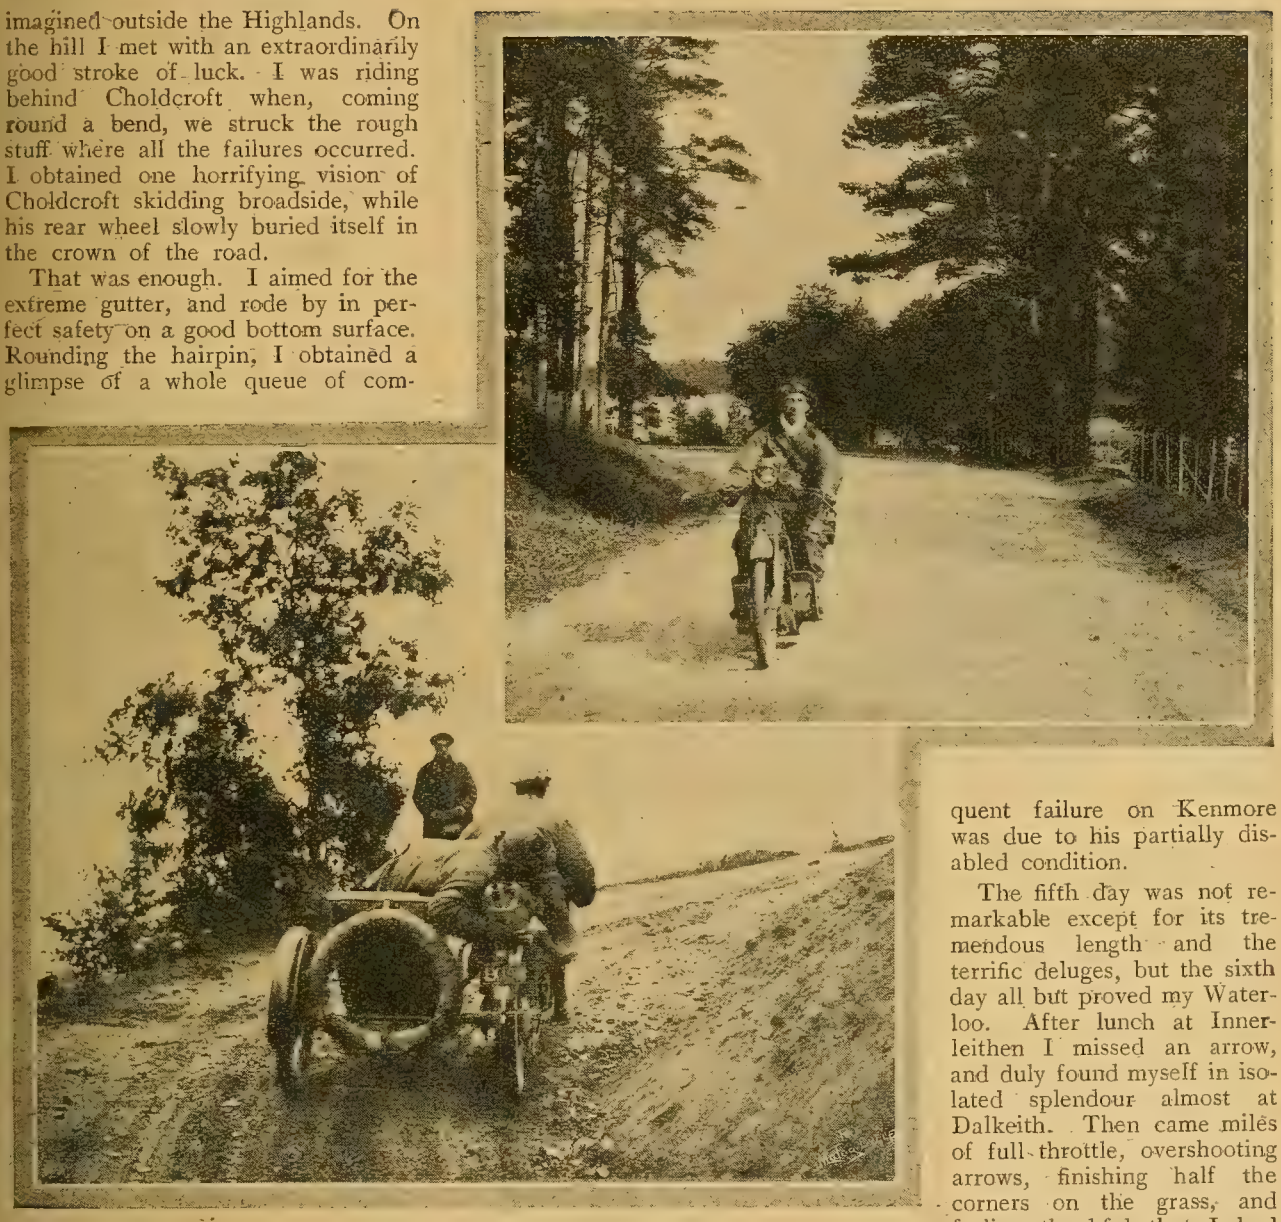


Better going on main roads near Pitlochry. G. V. Shaw (4 Norton) and Ellison Hawkes (3½ Douglas), followed by two other competitors.

The Scottish Six Days from Within.—

imagined outside the Highlands. On the hill I met with an extraordinarily good stroke of luck. I was riding behind Choldcroft when, coming round a bend, we struck the rough stuff where all the failures occurred. I obtained one horrifying vision of Choldcroft skidding broadside, while his rear wheel slowly buried itself in the crown of the road.

That was enough. I aimed for the extreme gutter, and rode by in perfect safety on a good bottom surface. Rounding the hairpin, I obtained a glimpse of a whole queue of competitors stuck on and about the point where Choldcroft had failed.



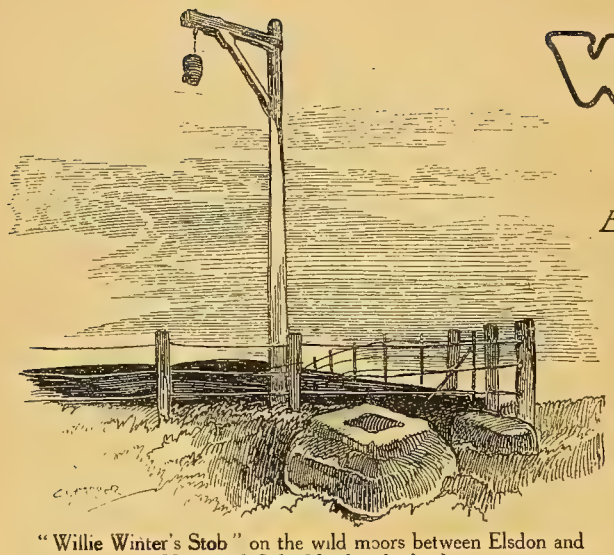
A CONTRAST IN ROAD CONDITIONS.

A. G. Cocks (Beardmore Precision) near Inverness, and C. H. Moir (Harley-Davidson sidecar) on Abriachan Hill a few miles further on.

A little while later, after a long ascent which terminated in a sharp bend round a protruding crag, I came upon my friend and team mate, Alan Hill, lying under his machine. It was one of those spills for which one cannot account, as the road surface was comparatively good. Hill had quite seriously damaged his leg, and at first we thought he had broken it. Ten precious minutes were lost ere we could get him astride his machine again, but the fall led to a short circuit in his ignition system and other minor troubles, which caused him, in a semi-dazed state, to lose twelve marks on time in this check. His subsequent failure on Kenmore was due to his partially disabled condition.

The fifth day was not remarkable except for its tremendous length and the terrific deluges, but the sixth day all but proved my Waterloo. After lunch at Innerleithen I missed an arrow, and duly found myself in isolated splendour almost at Dalkeith. Then came miles of full throttle, overshooting arrows, finishing half the corners on the grass, and feeling thankful that I had spared my engine earlier in the week. So on to Giffard, checking in at the last second of the last minute of my three minutes' allowance, and on again to Redstone Rig. Almost at the top the low gear chain broke, and there was nothing for it but to slam into high. A series of short, savage konks carried me past the non-stop section, where chain cases were torn off, and the discovery made that the spare chain would not fit. It was at this juncture that C. P. Wood sportingly came to my aid, giving up at least twenty minutes of his time on the twenty-seven miles check.

One word for the officials, who were gentlemen and sportsmen, and for the organisation, which was superb. Though a "reliability trial" in the true sense, this year's Scottish Six Days will prove a source of many happy memories to all who participated in it.



"Willie Winter's Stob" on the wild moors between Elsdon and Harewood Gale, Northumberland.

WAYSIDE GIBBETS

By Charles G. Harper

Some Gruesome Relics of Bygone Days seen by the Motor Cyclist on Tour.

"I WANTS to make yer flesh creep," like the Fat Boy in "Pickwick," but I realise fully that this is nowadays a difficult enterprise. Now that no one believes in ghosts—or, believing, would be impudent to one when it appeared, rather than afraid—and now that the horrors of war are done with, and we have come down from those high eminences of feeling, one's flesh refuses that symptom of fear and dread.

But I will do my best—no man can achieve more—and I propose to talk about gibbets. "Thank God, I have come back to a civilised country!" exclaimed the returned traveller long ago, when, coming back to England, home, and beauty, he perceived those evidences of an ordered and advanced state of society, the gibbets, on which hung the rotting bodies of executed highwaymen and other criminals. We have, in fact, a number of such objects, the gibbets, still in existence as relics in various parts of the country, but they have long ceased to bear their ancient fruit; and, indeed, the last instance of a person being hanged and his body afterwards exhibited in this way, as a warning to others, took place nearly a century ago, when the body of a murderer named Cook was gibbeted at Leicester in 1832.

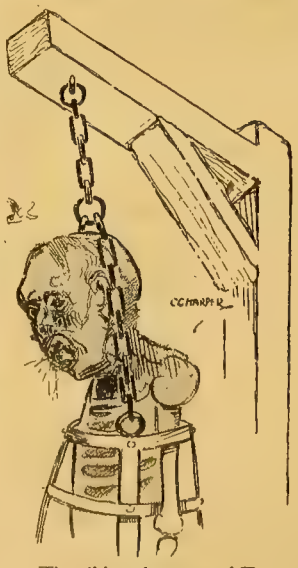
One of our most authentic original gibbet-posts, which is not now at its olden full height, may be found in a lonely by-road between Atherstone and Gopsall. It is well known locally as "Gopsall Gibbet," and the road itself is "Gibbet Lane." A board nailed to this relic says: "This gibbet was erected here in 1800, a quarter-mile from the scene of a murder committed by John Massey, February, 1800." I would like to know the details of that crime, but, although I have long sought, they elude my research.

The motor cyclist who finds these horrific wayside vestiges of the past very probably considers that such things were few. On the contrary, they were once common objects of the country; and if some people, who like quiet roads and contemplative, absent-minded walks in the middle of them, had their way, there might be a reappearance of them, and the motor cyclists themselves would dangle in chains and in iron cages just as the old criminals did. The practice was to suspend the body by chains, and in a neatly fitting iron framework, so that when the clothes rotted, and the body likewise, the skeleton might be held together. In the best regulated and most thoroughgoing circles, the body, clothes and all, was plentifully tarred on being hung up, so that it might last a very long time. And, lest relations might come and cut it down and bury it, the gibbet-post was usually studded with hundreds of nails and sharp spikes as a deterrent to climbing it.

As my intention is to give you the horrors, I cannot do better than talk about Tom Otler, and show a picture of what happened to his gibbeted carcase. Tom Otler, in the year 1808, murdered a woman in the lane still well known locally as "Gibbet Lane," Saxilby, in Lincolnshire. He was hanged at Lincoln Gaol, and his body was, following the old custom, gibbeted at the place of the crime. As time went on, some tomtits, seeking a likely place to build a nest, selected the gaping mouth of hanged and gibbeted Tom Otler, and in the nest thus built in this unconventional situation they reared seven young ones. The occurrence was so well known a local curiosity that it gave rise to a puzzle verse:

> "10 tongues in one head,
> 9 living and 1 dead,
> 1 flew forth to fetch some bread,
> To feed the living in the dead."

"What were they?" the stranger would be asked. And when he "gave it up," he was told, "The tomtits whose nest was in Tommy Otler's head." The irons from this gibbet are still preserved at Doddington Hall, Lincolnshire.



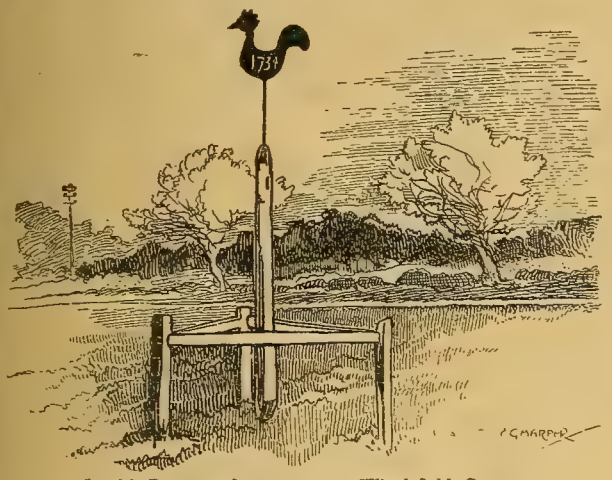
The gibbeted carcase of Tom Otler was made a nesting place for a family of tomtits.

An old gibbet, which may well compare with that at Gopsall, is "Jacob's Post," as it is called, on the wide common at Wivelsfield, between that village and Ditchling, in Sussex. It is the post on which was suspended the body of one Jacob Harris, a Jew pedlar, who in 1734 murdered two persons at the Royal Oak Inn, close by. The fragment of it now remaining is crested with the figure of a rooster (not a weathercock, because it is

Wayside Gibbets.—

a fixture, and won't go round) pierced with the date.

Turning again to the north, we find, on the wild moors between Elsdon and Harewood Gale, Northumberland, three miles north of Elsdon, a restoration of the gibbet on which was exposed the body of William



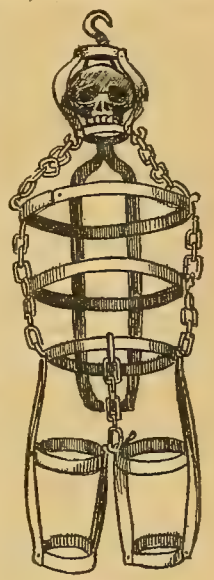
Jacob's Post, on the common at Wivelsfield, Sussex.

Winter, who in 1791 murdered an old woman, Margaret Crozier, who kept a small drapery shop, and was supposed to have plenty of money by her. Winter, with the aid of two pedlar women, Jane and Eleanor Clark, broke into the house and did the deed. All three were hanged at Newcastle-on-Tyne, and Winter's body swung here in the winds of this desolate spot in sight of the victim's abode, at the place called "The Raw," by the road leading to Scot's Gap. The existing post, styled "Willie Winter's Stob"—"stob" means "gallows" in the Northern dialects—has a wooden head hanging from it. Sir Walter Trevelyan caused the new post to be set up.

A Footprint Clue.

It is noteworthy that this cruel murder was brought home to the criminals, as so often, by what seemed a trivial incident. Winter and his companions were of a vagrant company of besom-makers. On the day before the murder, one Robert Hindmarsh, a shepherd boy, had idly amused himself by counting the hob-nails in the boots Winter was wearing, and noting their peculiar pattern, as he sat cutting sticks and making besoms. When footprints were discovered near the old woman's cottage, he mentioned this fact, and his evidence secured the conviction. When Winter's body, after some years, fell, a hideous effigy was made to take its place, and, that falling, a Moor's head was made and exhibited. Elsdon will not willingly forget that old tragedy.

What those cages were like which held gibbeted bodies we can see by the well-preserved specimen kept in Rye Town Hall. John Breeds, a butcher, was in 1742 hanged for murdering a Mr. Lamb. The crime was one of revenge. Unfortunately, Mr. Lamb was not the person whom Breeds had intended to kill. He mistook his victim for the real man, who had, therefore, the extreme satisfaction of seeing Breeds hanged, with his revenge not satisfied. There seem to be several morals to this story: the usual conventional ones, and another, which is, "Don't, if possibly you can help it, resemble anyone else." Mr. Breeds's "irons," as they are called, stand on a dark staircase, and give strangers the jumps.



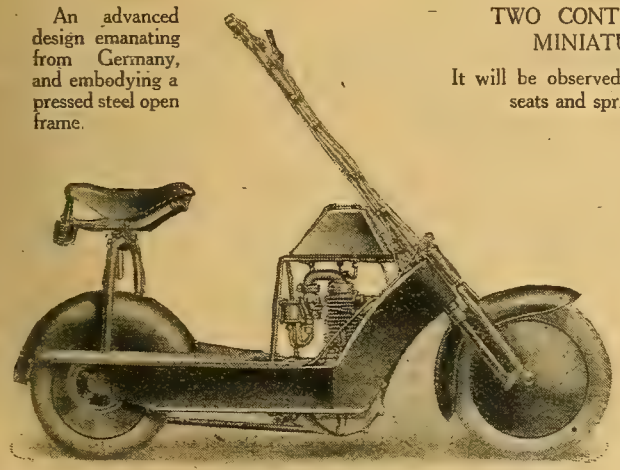
"Mr. Breeds's Irons," which stand on a dark staircase in Rye Town Hall

I will conclude with a notice of the spot called "Three Maids' Cross," a tall wooden cross in the hedge on the right-hand side of the road as you go from Winchester to Ludgershall, five miles from Winchester. The legend, which gives no date to the occurrence, tells us that three sisters were buried here, up to their necks, for poisoning their father, and so left to die of starvation. It was just one of those picturesque punishments in which the Middle Ages were so fruitful: not, like the punishment in the "Mikado," "humorous and lingering," but lingering without the humour.

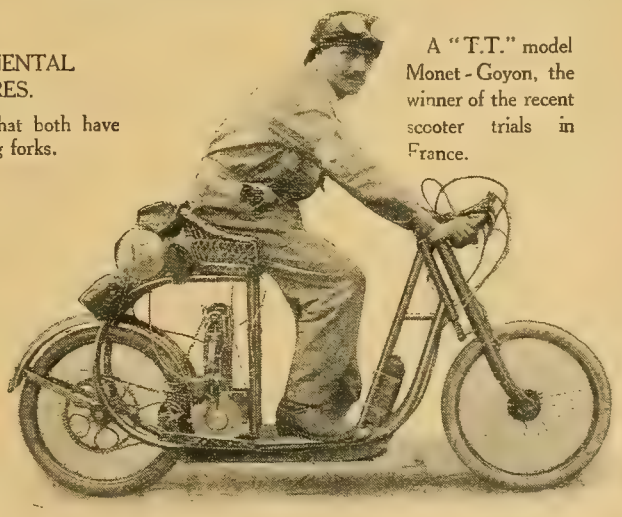
TWO CONTINENTAL MINIATURES.

It will be observed that both have seats and spring forks.

An advanced design emanating from Germany, and embodying a pressed steel open frame.



A "T.T." model Monet-Goyon, the winner of the recent scooter trials in France.



THE ANGLO-DUTCH TRIAL.

A Brief Review of Previous Events and the British Teams competing in them. This Year's Team for the Contest on Aug. 7th.

THE annual Anglo-Dutch Trial, between representative riders of Great Britain and Holland, owes its inception to a visit of members of the Dutch Motor Cycle Club in 1911. The very friendly relationship which sprang into being between these riders of Holland and *The Motor Cycle*, as a result of that visit, brought about the first trial which was organised by the Dutch club in 1912.

Three types of machines were catered for in pre-war events: *i.e.*, machines up to 350 c.c., over 350 c.c. and up to 500 c.c., and over 500 c.c., and each class has been open to three trade and three private owners of each country. The competitive teams being selected by popular vote.

In the first event, held in Holland in August, 1912, the Dutch team won by thirty-five points against representative British riders of that year. The British team consisted of the following:

UP TO 350 C.C. CLASS.—Private owners: F. C. Wasley (2¾ Douglas), C. M. Down (2¾ Enfield), and *Geoffrey Smith (2¾ Humber). Trade: *W. W. Douglas (2¾ Douglas), R. Holloway (2½ Premier), and *S. Wright (2¾ Humber).

351 C.C. TO 500 C.C. CLASS.—Private owners: Vernon Taylor (3½ Rudge), *Fred Dover (3½ Premier), and *E. Lester (3½ P. and M.) Trade: *W. F. Newsome (3½ Triumph), *W. Pratt (3½ P. and M.), and *J. H. Slaughter (3½ New Hudson).

OVER 500 C.C. CLASS.—Private owners: *W. Cooper (3½ Bradbury), *C. W. Wilson (Morgan), and A. E. Uffleman (6 Rex-Jap). Trade: *Frank Smith (5-6 Clyno sc.), *F. W. Barnes (6 Zenith sc.), and *F. A. Applebee (3¾ Scott sc.).

Second Contest won by British Team.

In 1913 the Continental riders came to England, and the trial resulted in a win for the British team by a far greater margin than that by which the visitors won the year before in their own country. Many of the same British riders competed, their names being printed in italics in the list given below.

UP TO 350 C.C. CLASS.—Private owners: *W. Cooper* (2¾ Humber), **Geoffrey Smith* (2¾ Humber), and *F. A. Hardy (2¾ Douglas). Trade: **S. Wright* (2¾ Humber), **R. Holloway* (2½ Premier), and *W. B. Gibb (2¾ Douglas).

500 C.C. CLASS.—Private owners: **F. Dover* (3½ Premier), **C. Lester* (3½ P. and M.), and A. R. Abbott (3½ Rudge). Trade: **W. Pratt* (3½ P. and M.), **W. F. Newsome* (3½ Triumph), and *F. C. North (3½ Ariel).

OVER 500 C.C. CLASS.—Private owners: *R. G. Charlesworth (6 Zenith), **C. W. Wilson* (Morgan), and R. E. Guest (8 Matchless sc.). Trade: *C. R. Collier (6 Matchless), **F. W. Barnes* (6 Zenith), and **F. Smith* (5-6 Clyno sc.).

Those marked with an asterisk made non-stop runs.

Thus it will be seen that a number of British competitors have clean sheets in the two events which were run before the war. These include S. Wright, Geoffrey Smith, R. Holloway, F. Dover, C. Lester, W. Pratt, W. F. Newsome, C. W. Wilson, F. W. Barnes, and F. Smith.

The 1914 event was abandoned owing to the war. On August 4th a representative British team will again visit Holland, including a few of the 1912 and 1913 riders. Fred Dover, W. Pratt, and Geoffrey Smith are the only riders in this year's team who have competed in both pre-war events, while W. B. Gibb, C. R. Collier, and F. A. Hardy, who competed in 1913, are also included

When the Dutch team came to England in 1913. A visitor on a Dutch-built Simplex ascending Station Hill, Wycombe.

The 1920 British team selected is as follows:

UNDER 500 C.C.

PRIVATE OWNERS.

T. Rutherford	3½	Sunbeam.
Geoffrey Smith	3½	Sunbeam.
Lt. Glen. Kidston, R.N.	3½	Sunbeam.
E. A. Edwards (reserve)	3½	N.U.T.

TRADE.

W. B. Gibb	2¾	Douglas.
H. Gibson	2½	Clyno.
J. A. Newman	3½	Sunbeam.

OVER 500 C.C. SOLO.

PRIVATE OWNERS.

D. H. Noble	5-6	Rover.
F. A. Hardy	5-6	Zenith.
F. Dover	4	Triumph.
G. W. G. Codd (reserve)	10	Reading-Standard.

TRADE.

Kaye Don	6	Zenith.
L. Newby	6	Ariel.
G. W. Moffatt	4	Douglas.

SIDECARS.

PRIVATE OWNERS.

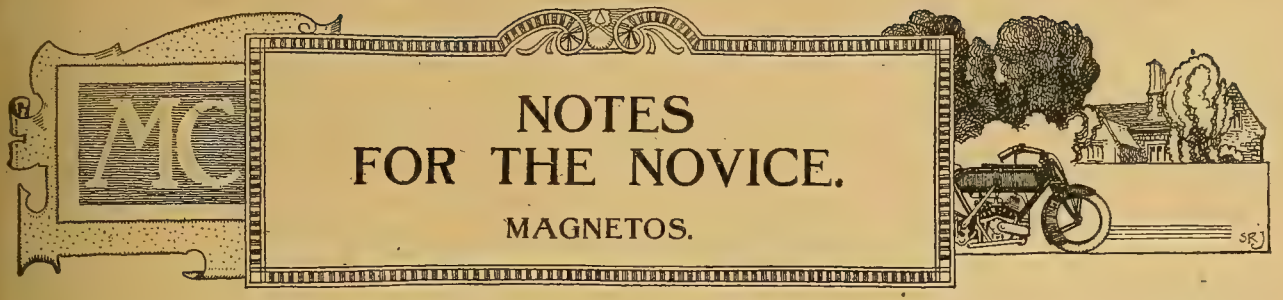
C. H. Boynton	5-6	James sc.
C. Crossthwaite	5-6	James sc.
W. A. Fell-Smith	8	Blackburne sc.
S. Bannon (reserve)	7-9	Harley-Davidson sc.

TRADE.

C. R. Collier	8	Matchless sc.
H. A. Collier	8	Matchless sc.
W. Pratt	6	A.J.S. sc.
E. B. Ware (reserve)	8	Matchless sc.
H. F. S. Morgan (reserve)	8	Morgan.

The above teams are the choice of the A.C.U. and affiliated clubs who were asked to vote for their preference among a long list of names submitted.

As previously mentioned in *The Motor Cycle*, the Dutch Club is making arrangements to give the British representatives a real hearty welcome, and no doubt, whichever team scores the highest in the trial, the visit will further cement the very cordial relationship existing between the two countries. In proportion to its population, Holland is probably second to Great Britain as a motor cycling country, and much is gained by these international contests, of which there are so few.

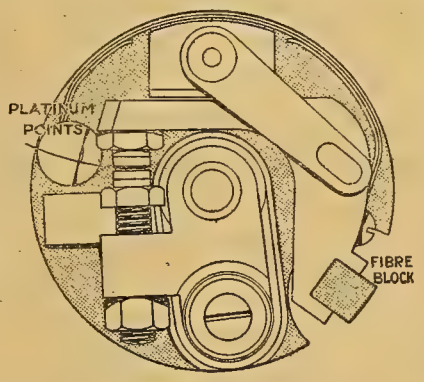


NOTES FOR THE NOVICE.

MAGNETOS.

IT is not proposed to enter here into a scientific discussion on the theory of magneto ignition and the construction of the magneto. Readers who wish to acquaint themselves more fully with these mysteries are advised to refer to "Magnetos," by A. P. Young, A.M.I.E.E., or to the excellent articles on this subject which are included in the latest edition of "Motor Cycles and How to Manage Them," both published by Messrs. Iliffe and Sons Ltd., 20, Tudor Street, London, E.C.4.

A few hints on the care and adjustment of magnetos may, however, help the novice to avoid trouble; but it may be said at once that the magneto needs very little attention, and a very good rule is "to let well alone." It is, of course, desirable to keep the outside of the instrument clean, and, while the cleaning is being carried out, it is easy to notice whether or not the magneto is firmly fixed to its bed, and that the screws which hold the instrument together are tight. I have known much trouble, including the return of the magneto to its makers for overhaul, to ensue from neglect of these simple precautions. It must be remembered that the magneto is a delicate piece of mechanism, which must be treated with care, but it is at the same time one of the most reliable parts of a modern motor cycle.



Make-and-break of a well-known British magneto.

Timing.

There is no one general rule for the timing of magnetos, which varies in the case of different engines and for different purposes—*e.g.*, a greater advance is given for racing than for touring work, and, again, when a sidecar is attached, a slight retard is often beneficial. In this case, it is better to retard the timing throughout than to run the engine with the ignition lever somewhat retarded, as, when this latter method is adopted, the spark is not occurring at the moment of its greatest intensity.

In the case of a 3½ h.p. single-cylinder engine, the following timing can be recommended for general purposes and touring. Set the engine on the top dead centre at the end of the compression and commencement of the firing strokes, and connect up the magneto (ignition lever two-thirds retarded) with the platinum points just separating. In screwing up the nut which holds the sprocket or pinion to the spindle of the magneto, great care must be used, for, as the sprocket is a taper fit on the spindle, and held in its place by friction only, it is very easy to derange the timing while tightening the nut, and it is always advisable to check the timing again when this is completed. The top dead centre just referred to can be found as follows: Open or remove the compression tap, if one is fitted to the top of the cylinder—if not, remove the plug—and, by inserting a piece of wire, note when the piston comes to its highest position. In a two-stroke engine, this is all that is required; but, in the case of a four-stroke, the engine must be slowly rotated, and the movement of the valves carefully watched. On one occasion, as the piston reaches its highest position, the exhaust valve will close and the inlet open; on the next rise of the piston, no valve movement will take place, and the latter shows the top dead centre required.

Small engines, which naturally run at a higher speed, and racing machines should be timed with the ignition levers fully retarded instead of only two-thirds. Two-stroke engines generally require a considerable advance, but on one occasion I effected a real improvement in the running of a two-stroke by timing the magneto somewhat later than the makers had done.

The amount of advance and retard is usually 20° on the magneto contact breaker, and, as the magneto, on a four-stroke, runs at half engine speed, this means 40° of rotation on the engine itself. On two-strokes, and in all cases where the magneto runs at engine speed, the timing variation is reduced to 20°.

Multi-cylinder Engines.

On multi-cylinder engines, where the firing intervals are equal, as they are in the case of flat twins, four-cylinders, vertical twins with cranks at 360°, and vertical twin two-strokes with cranks at 180° (as the Scott), magneto ignition presents no difficulty. But where the firing intervals are unequal, special provision must be made to meet these conditions, and the difficulties increase as the discrepancy in the firing intervals becomes greater.

In V twin engines having an angle A between the cylinders, the firing intervals are 360 + A and 360 − A alternately. On the magneto these intervals will be halved. Thus the firing intervals are:

Angle.	Intervals on engine.	Intervals on magneto.
45°	405 and 315	202½ and 157½
50°	410 and 310 ...	205 and 155
60°	420 and 300	210 and 150
90°	450 and 270 ...	225 and 135

Notes for the Novice.

Originally, the spark was set to occur before the maximum position in one cylinder, and after it in the other; but, later, the conditions were improved by means of staggered armatures and other devices, and I understand that a special magneto has been designed by Mr. A. P. Young for 90° engines, in which type the discrepancy of the intervals is very marked.

Adjustment.

It is not advisable for the novice to take down a magneto for repairs, but there are one or two points where adjustment or attention may be required. The platinum points on the contact breaker should separate ½ mm., and this distance can be checked by the gauge provided on the magneto spanner. If this gap is allowed to increase, the timing will in consequence become more advanced, as the fibre block will strike the steel cam on the periphery of the contact breaker a little earlier, while, if the gap decreases, which it may do by the wear of the fibre, the contrary takes place.

Freeing the Rocker Arm.

Sometimes, especially in damp weather, the rocker arm may become tardy in operation, owing to the swelling of the fibre bush on which it works. If it sticks entirely, the trouble is easily located, but occasionally when tested by hand it seems to be working satisfactorily, but it is not in reality springing back with sufficient quickness to allow the magneto to function as it should. It will now be necessary to remove the contact breaker by taking out the centre screw. This done, the spring of the rocker arm should be released, care being taken that the tiny screw is not thrown by the spring into the corner of the motor house. A roll of fine emery-paper may next be used to ease the bush, but the best thing, in my experience, is a twist drill of suitable size. This should be revolved backwards while being inserted, so that the corners of its cutting edge may not damage the bush.

Some magnetos are, owing to the method of their construction, immune from this trouble, as they are fitted with metal bushes, or, like the C.A.V., have no bearing at this point. A little vaseline on the edge of the contact breaker ring will make it work more freely, and help to keep out the wet, and if this part is inclined to stick, a cure may often be effected by increasing the pressure of the spring which holds the contact breaker cover in place.

The Carbon Brushes.

It used to be the custom to recommend that the carbon brush, from which the current is taken to the plug, should have its end roughened when it became glazed, but this is now considered quite undesirable. It is necessary, however, to remove the brush with its holder from time to time, and to clean the slip ring with a piece of clean rag soaked in petrol; this can be wrapped round a piece of wood, such as a pencil. In the event of the carbon brush being broken or lost, a substitute may be made from a piece of lead-pencil, or in some cases the holder may be inserted a little further, and the spark will jump to the brass tube, which normally contains the carbon brush.

J.H.W.

The A.C.U. Six Days Trial.

Positions of Hills not to be Known to Competitors. Three Judges to Test Machines for Silence. Entries limited to 150.

THE preliminary regulations for the A.C.U. Six Days Trial have now been issued. It has been mentioned already in *The Motor Cycle* that the trial is to conclude with half an hour's run at speed and a brake test on the test hill at Brooklands.

Those who disapproved of the "silence" test in last year's trial may be disappointed to learn that a test for "silence" will again be included. This time there will be three judges, one using the Low audiometer, and the other two will judge by ear.

Tests will be made on the first and last days, and five marks, or less, will be forfeited in each test. Only the quietest motor cycle in each class will lose no marks.

System of Marking.

200 marks will be credited to each competitor distributed as follow:

100 marks for reliability, i.e.,—adherence to schedule, 1 mark per minute, or part of a minute, over allowance will be deducted. Maximum penalty will be 50 in any one day.

50 Marks for Hill-climbing.—The positions of the hills will not be published. 5 marks will be deducted for one or more stops on any one test hill.

Braking.—Motor cycles to descend Brooklands test hill without stopping at a maximum speed from top to bottom of 10 m.p.h. 20 marks, or less, at the discretion of the judges, will be deducted on results only, without design being taken into consideration.

20 Marks for Condition at Finish.—Competitor or entrant may be present at the examination following the half hour's running on Brooklands. 5 marks or less may be deducted at the discretion of the judges, and for defects obvious on examination. 5 marks for failure to reach the schedule speed, plus1 mark for every mile or part of a mile per hour below that speed, up to a maximum of 15 marks. The schedule speeds are:

Solo.	m.p.h.	Sidecar.	m.p.h.
250 c.c.	25	350 c.c.	22
350 c.c.	30	500 c.c.	24
500 c.c.	35	750 c.c.	28
750 c.c.	38	1,000 c.c.	32
1,000 c.c.	40	Over 1,000 c.c. ...	33

10 Marks for Silence.—5 marks or less in each of tests on first and last days. The quietest motor cycle in each class to lose no marks.

Fuel consumption during part of the trial may be recorded.

Minimum weights and tyre sizes are the same as last year; *i.e.*, 250 c.c., 88 lb. (1¾in.); 350 c.c., 110 lb. (2in.); 500 c.c., 132 lb. (2¼in.); 750 c.c., 154 lb. (2¼in.); 1,000 c.c., 176 lb. (2½in.).

Awards will be granted on the following marks:

	Gold.		Silver.		Bronze.	
	Solo.	Sc.	Solo.	Sc.	Solo.	Sc.
250 c.c.	150	— ...	135	— ...	110	—
350 c.c.	175	150 ...	165	135 ...	140	110
500 c.c.	175	160 ...	165	145 ...	140	120
750 c.c.	180	175 ...	170	165 ...	145	140
1,000 c.c.	180	175 ...	170	165 ...	145	140
over 1,000 c.c.	—	175 ...	—	165 ...	—	140

The entry this year will be limited to 150 machines, and entries close at mid-day Saturday, July 31st. The fees are, trade (manufacturers, traders, and riders in their employ), £12 12s.; private owners, £6 6s.; or if a member of any affiliated club, £5 5s.

The address of the Auto Cycle Union is 83, Pall Mall, London, S.W.1.

The Big Twin Sidecar at Record Speeds.

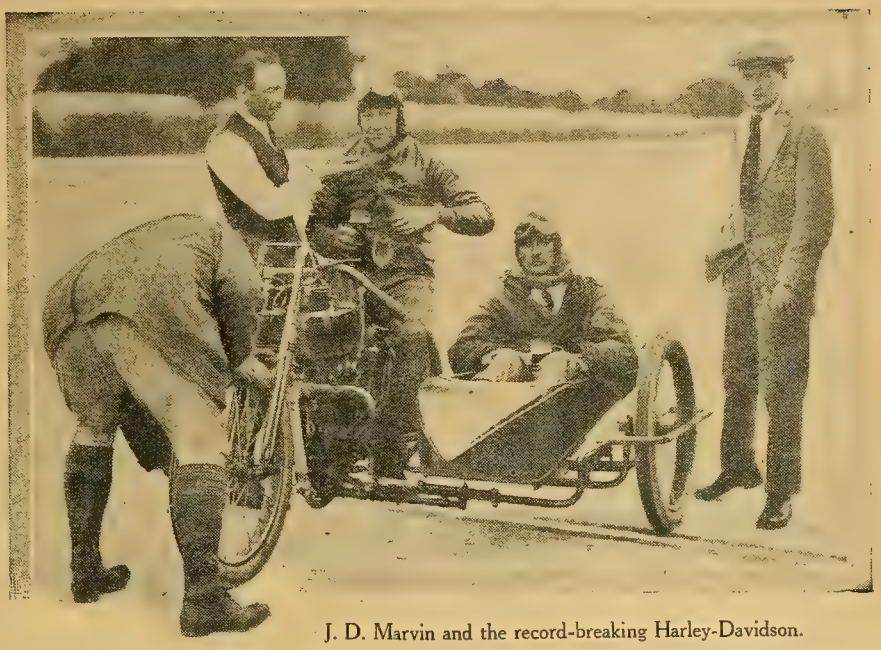
A PARTICULARLY fine series of records was put up on the 12th inst. by a standard Harley-Davidson magneto model to which a light sidecar was fitted. The performance was due to the private enterprise of Messrs. Ballards Motors, Ltd., 92, Gloucester Road, South Kensington, London, S.W.7, and, contrary to usual practice, two drivers were employed—Messrs. J. D. Marvin and J. A. Sullivan—who each took two-hour spells of driving. Mr. Marvin, who is a partner of Messrs. Ballards Motors, has only one leg.

The following is a list of the records attained:

	Miles.	Yards.	M.P.H.
2 hours ..	106	1,025	53.29
3 ,, ..	160	909	53.50
4 ,, ..	212	1,564	53.22
5 ,, ..	256	46	51.21
6 ,, ..	308	1,739	51.40
7 ,, ..	360	1,136	51.52
8 ,, ..	404	279	50.51
9 ,, ..	456	398	50.69
10 ,, ..	508	759	50.48
11 ,, ..	558	846	50.77
12 ,, ..	609	1,087	50.8

In addition to these the following distance records were made:

	h.	m.	s.	M.P.H.
100 miles in	1	53	1⅘ ..	53.09
150 ,,	2	48	53⅘ ..	53.29
200 ,,	3	45	45⅘ ..	53.17
250 ,,	4	53	13½ ..	51.16
300 ,,	5	50	10⅘ ..	51.40
350 ,,	6	48	22½ ..	51.42
400 ,,	7	55	26¼ ..	50.47
500 ,,	9	50	50¼ ..	51.77
600 ,,	11	48	39½ ..	50.8



J. D. Marvin and the record-breaking Harley-Davidson.

The petrol consumption worked out to 50 m.p.g., which is remarkably good. A single lever Schebler automatic carburetter was employed. The sidecar body was a canoelet, the oil used Wakefield's Castrol, and the petrol Pratt's No. 1. Other items of the equipment were K.L.G. plugs, a B.L.I.C. magneto, Palmer cord tyres, Coventry chains, and Brooks saddle.

Will Two-strokes Keep Cool?

THE manufacturers of the Ivy motor cycle have decided to concentrate on a 348 c.c. engine (75 × 79 mm.) for next year, and, being determined to disperse the impression that two-strokes overheat, at least as far as their own product is concerned, they undertook twenty-five consecutive ascents (non-engine-stop) of the old Wyche at Malvern.

The demonstration machine was in the hands of Mr. Percy Newman, and, the tanks filled, he started at 12.27. Descending the "new" road he took the by-road to the foot of the Old Wyche and commenced the climb, rounded the hairpin at the top, and recommenced the circuit. His time for the first lap, of 1.6 miles, was five minutes; of this distance about half-a-mile is on the ascending gradient which reaches a maximum of 1 in 2.8 at the top.

With only slight variations from the five minutes per circuit the rider continued with the utmost regularity. It was noticed that on each round very little departure was made from the wheel tracks of the previous circuit and gear changes were made in exactly the same place each time, bottom gear being used on the last 150 yards of steep gradient only; incidentally, a Sturmey-Archer three-speed box was employed, in conjunction with all-chain drive.

The last lap was completed at a higher speed and Newman came up the 1 in 2¾ at a great pace to receive the congratulations of the observers, exactly two hours eight minutes after starting.

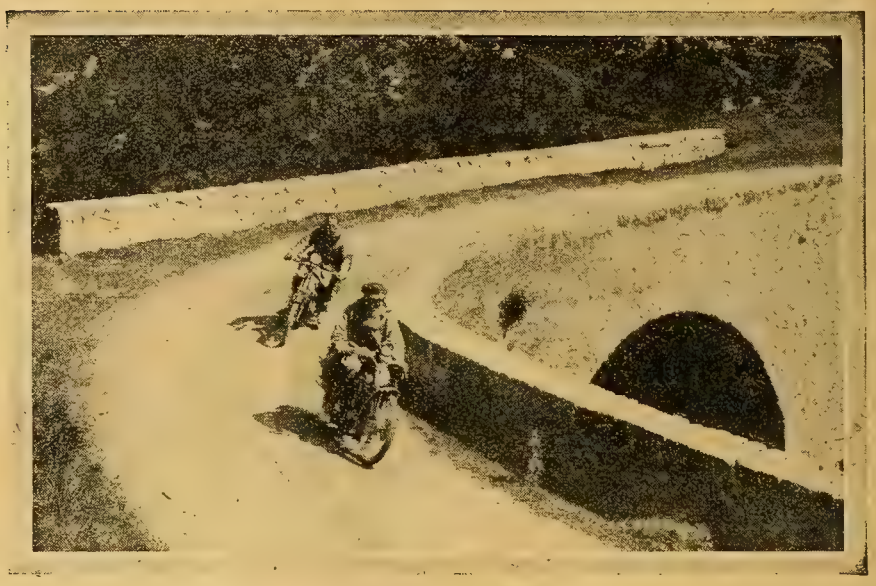
The distance covered was forty miles, the time taken was 2hrs. 8mins., and the average speed, therefore, was 18.75 m.p.h. Immediately the engine was stopped it was examined, but no sign of excessive heat was observed, the cylinder was at a normal temperature and the hand could be placed momentarily on the radiating fins. Altogether the demonstration was one which clearly shows that the 3 h.p. Ivy two-stroke is equipped with an engine capable of undertaking any task imposed by the normal rider. The test was observed by a representative of the A.C.U.

Breasting the 1 in 2¾ section of the Old Wyche for the twenty-fifth time.

REFLECTIONS ON THE SCOTTISH TRIALS.

Some Impressions of the Six Days Trials in the Highlands.

Notes on Hills and Outstanding Performances of Riders by an Observer who covered the Course.



Lt. Lochead, whose 2¾ h.p. New Imperial appeared to be quite an old and well-used model, nevertheless made some excellent performances on the hills. In the picture he is closely followed by McGregor (3½ Brough single-gear) over a bridge near Brora.

ONLY twenty-six competitors out of ninety-four starters in the Scottish Six Days Trial secured gold medals. If viewed superficially, this low percentage of successes would seem to reflect discredit upon the modern motor cycle.

It is perhaps well to remember that a competitor had only to lose one mark to forfeit his "gold." A stop on one of the ten test hills through carelessness or misfortune, or to be more than three minutes behind schedule time at any one of the thirty-three checks, was sufficient to relegate a rider to the second class.

That twenty-six riders covered the difficult course without loss of a single mark is a remarkable tribute to the reliability of present-day motor cycles.

Anyone fresh back from the Highlands, with its memories of hills, hairpin bends, bad roads, and the rain must indeed marvel at the performances of both men and machines.

Tyres the Chief Evil.

Tyre troubles and falls were responsible for more failures than mechanical deficiencies. B. Alan Hill (3½ P. and M.) can usually be counted on for a gold medal, yet was knocked out on this account. He had a fall on Thursday that was mainly responsible for his failure on Kenmore the following day, because he could not use his leg to steady himself in the deep ruts at the foot of the hill. Jesse Baker (3¾ Scott) is another consistently good performer who had to retire through a fall, although his machine was in no way damaged. W. Westwood (Triumph) made a third expert rider who lost a premier award by a fluke. He changed into "top" a little too soon on Mam Ratachan, causing a momentary wobble in the rough.

Causes of retirement were various. A. Alexander (7-9 Indian) had two punctures in the first twelve miles of the trial, and retired when the rear tyre collapsed altogether. Campbell McGregor (3½ single-geared Brough) averaged about five punctures per day, and finally retired on the sixth day through this cause. O. P. C. Collier (Beardmore-Precision) so damaged his machine in a fall that he was unable to proceed. Beck (8 New Imperial sc.) retired on Tuesday owing to the bearings of his rear wheel giving out. D. Wright (4 Blackburne) burst a tyre, and had a fall that caused his retirement, while J. Morton on a sister machine had a collision with a Ford van. Tom Peck (4½ Ariel) had tyre troubles, and in striving to make up time fractured his piston. G. W. Lush, who very sportingly drove a 3 h.p. A.B.C. with a sidecar, can blame tyre troubles for his failure to finish. He had persistent punctures, and when he arrived in the control on Wednesday night (when the rules allowed a change of tyres), his rear tyre was in ribbons. Making up time and riding with a flat tyre may have been responsible for the fork breaking on the last day.

Illness was responsible for Mrs. Knowles's withdrawal on the sixth day, and a smash through taking a right-hand bend too fast accounted for Hamilton (Harley-Davidson sc.) Water in the magneto led to the retirement of J. Westwood Wills (2¾ Verus). The causes of the retirement of "Parson Wilkin," as the Rev. J. M. Philpott (2¾ Wilkin) came to be known, were many, but he was finally knocked out by his carrier coming adrift.

Few Mechanical Troubles.

Serious mechanical breakdowns were exceedingly few. E. C. Palmer (A.B.C.) had a broken camshaft, and Mrs. Bell (6 A.J.S. sc.) within a mile of the finish also had engine trouble. Norman Black (Norton) with only a few miles to go, "chewed up" his gears.

So much for the unfortunates. One must admire many of them for their plucky but futile efforts to carry on under difficulties. We will now consider the credit side of the balance sheet.

There were few new machines to attract attention, but many watched with interest the performances of the new P. and M.'s. This was their first appearance

Reflections on the Scottish Trials.—

in a really long and severe trial, and they have distinguished themselves considerably. To begin with, it takes a good 500 c.c. machine to maintain schedule time over such a course, and yet be able to make clean ascents of all the observed hills; and secondly, their steering and road-holding propensities were noticeably good on loose surfaces.

Another machine which has so far done but little competition work in this country is the 3½ h.p. spring frame Douglas. Ellison Hawkes, the rider of the only one in the trial, was dogged with tyre trouble, but was delighted with the smooth pulling of the engine, and at times one could not help envying his smooth and comfortable progress over the villainous roads. He managed to secure a "bronze."

Tyre troubles, as already mentioned, were frequent and disastrous throughout the trial, but large tyres have suddenly come into great prominence, and most of the machines so fitted were entirely immune from punctures. Good riding plays a very important part over Scottish roads, and it was curious that so many of our very best and steadiest riders lost marks through falls this year.

J. A. Newman (3½ Sunbeam), H. M. Batten (3½ P. and M.), L. Guy (3¾ Scott), and A. L. Downie (2¾ Wilkin) were all conspicuous for their fine riding, and Hugh Gibson's performance on the little two-speed two-stroke Clyno was a thing to wonder at. A fall on the Spittal of Glenshee damaged his footrests to such an extent that he constantly "blinded" so as to have time to refix them temporarily, yet his little engine never overheated, and climbed all hills comfortably.

While on the subject of riding, both the lady competitors deserve special mention, though both had extremely hard luck. Olive M. Knowles, after some riding which astonished even the old hands, was forced to retire through laryngitis, developed on the last morning, and Mrs. Duncan Bell failed in Princes Street, Edinburgh, within pushing distance of the finish.

TALLA LINNS ON THE LAST DAY.
Miles of this kind of rough road were responsible for many tyre troubles.

Only two single-geared machines remained in the trial long enough to be interesting, and of these Campbell McGregor (3½ Brough) was eliminated by tyre trouble, while Robert Carfrae (4 Triumph), though he failed on five hills, lost no marks on time, and is to be congratulated on a very sporting, if somewhat arduous, ride.

There were no single-cylinder sidecars in the trial—the first time the Scottish Six Days entry has not included such machines. This was perhaps unfortunate, because the single is undoubtedly the utility mount for the masses, and, although to have got a 4 h.p. sidecar through the trial would have been no mean achievement, the chances of success well merited the effort on the part of some of the makers of these popular machines.

The performance of the little A.B.C. sidecar was really remarkable, for it must be remembered that the engine has a capacity of only 400 c.c., and yet it got round, with only one hill failure, to within fifty miles of the finish.

If I were asked which make I considered had put up the best all-round performance, I should hesitate between the B.S.A., the Clyno, the Rover, and the P. and M. The only Coulson B entry also secured a "gold." This was the only 100% result achieved by any make of machine.

The B.S.A. record is decidedly good. Seven were entered, four obtained "golds," and three "silver." They secured the team prize, as they deserved to do, thus repeating their performance in last year's A.C.U. Six Days Trial in Wales.

Next in order of merit—although standing alone on account of the type of machine used—comes the Clyno. Three lightweights started and finished, and one secured a "gold" and the lightweight prize. One 8 h.p. model competed and also obtained the premier award.

Rovers were the only other make to have their riders finish intact. Of the four entered two secured gold, one each silver and bronze medals. H.D.T.

LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

REUNION OF EX-D.R.'S.

Sir,—I am an interested reader of the correspondence *re* Ex-Sergeant Schofield's scheme for a reunion of D.R.'s, which, by the way, I think is excellent, but why confine it to 1914 men only? I was at Dunstable early in 1915, volunteered, and was sent out to France, months before some of the 1914 men, who, in the meantime, had evaded drafts, reached the base at Abbeville.

Wrexham. 1915 A.C.O. SIGS.

A.C.U. SIX DAYS TRIAL.

Sir,—As a possible competitor in the above event, may I suggest that when the regulations are issued by the A.C.U. they should be complete, so that all the conditions are known before an entry is invited? There is no real reason why there should be any last minute "final regulations," and, whilst we cannot control the interpretation of these regulations, it is nicer to know them before entering, or to have an opportunity of refraining from doing so if in disagreement with them. V. E. HORSMAN.

THE SMALL TWO-STROKE.

Sir,—I have been astonished at the capabilities of the modern "baby" two-stroke. My machine has been in daily use for the last seven months, and I have reason to feel grateful for its mechanical simplicity, its unfailing reliability, and surprising power. Not so many issues back brother "Ixion" indulged in a few morbid reflections on noting the large proportion of youthful two-strokists among the present-day motor cycling fraternity. I am of opinion that this proportion will still further increase, because the two-stroke engine provides such a delightful mount. To those of us who "saw the world and got paid for doing it" during the year 1914-1918, the steady hum of the two-stroke is as soothing to the nerves as a pipe of the choicest tobacco. Personally, the four-stroke single (mechanically magnificent, I willingly admit), with its "hot-stuff" exhaust, produces nervous irritation akin to that engendered by a salvo of French "75's." Praised be he who invented the Scott, the possession of which so often fixes the *Ultima Thule* of ardent two-strokists. If Beardmore Precision is disguised as half-way house, the patient wayfarer will hardly go astray.

West Bergholt. VA DOUCEMENT.

POLICE PERSECUTION.

Sir,—It is with great interest I have read communications from many of your readers on the subject of "police persecution." I think that the Rev. R. C. Measures has got the present condition of affairs pretty well sized up, and I sincerely hope that the associations will do their utmost to try and put an end to the useless interferences of the police. In this district at present the police are conducting a great campaign against "long exhausts," and several of my friends have been recently fined and ordered to remove the long pipes. I am quite aware that open exhaust pipes are against the law (though I may say my own is four and a half feet long and two and a half inches in diameter), but I am of the opinion that if motor cycles were as effectually silenced as motor cars there would be many more accidents. A motor car has bulk which is easily seen; a cycle has not bulk, and consequently is not so easily seen. Therefore, I say, let the cyclist have the kind of exhaust that makes its presence felt. In this town there are some busy corners where the traffic is not too well regulated, and pedestrians wander about like lost souls. The unfortunate cyclist is expected to disengage his clutch with one hand, throttle down with the other, and keep his horn going with what? Yes, indeed, I agree heartily with your correspondents. If the police paid more attention to motor thieves than to technical offenders they would be doing a lot more good. K.A.M.

Edinburgh.

Sir,—I heartily agree with everything said by "Cricket" in your issue of the 1st. I was myself made the victim of an organised "round-up" in the town of Rhyl, North Wales. Apart from this, some of the police seem to think it their bounden duty to be as insulting as they can to any motorist whom they are "lucky" enough to catch.

If we must have these "round-ups," at least let us have sane men to carry them out. I may also mention that on the same day I was caught, I saw three men drunk in the streets at five o'clock in the evening, so evidently there is work for the "splendid organisation" of the police in other directions.

St. Asaph. TWO-STROKE

On Kenmore hill in the Scottish Trial. R. B. Clark (2¾ Coulson B), who rode the only machine of this make in the trial and secured a gold medal

LEFT-HAND DRIVE.

Sir,—In spite of all arguments to the contrary, I fail to see the danger and disadvantage of left-hand drive, on what J. Harrison is pleased to call foreign vehicles, provided that ordinary care, due from all drivers of motor cars, is exercised.

I also suggest that J. Harrison and other nervous road users, possessing cars with right-hand drive, fit similar devices to that proposed by the former to actuate on the left of their cars, thus ensuring perfect immunity from collision to all concerned. R.C.P.

Garstang.

SANS MAGNETO.

Sir,—I was very much interested in the letter by Mr. A. R. Jones *re* running without magneto. I hardly think he is correct in crediting the ignition to carbon, however. Would it not be possible for a fairly high compression engine to ignite the charge by virtue of the heat set up on the compression stroke, or, in other words, on the Diesel principle? I fancy on a two-stroke engine this would result in four-stroking, but, as I am no theorist, I will leave it at that. Hoping to see other readers' opinions on this interesting point, and wishing your paper every success.

Monkseaton. VALVELESS.

SILENCE TEST IN A.C.U. SIX DAYS TRIAL.

Sir,—Under the heading of "The English Six Days Trial," I see it stated that the silence test is not to be renewed on account of its unpopularity.

I am naturally unable definitely to state any decision upon this point, further than the regulations which must be familiar to you, but it is a fact that the unpopularity existed solely with a few competitors.

The vast bulk of the public for whom the Auto Cycle Union caters were much impressed at a genuine attempt on the part of the Union to render the motor cycle less unpleasant to the public and less unpleasant to the every day, apart from the professional, user.

It was also stated that noises recorded by the instrument were not distinguishable from the unpleasant note which chiefly affects the human ear.

The audiometer can be made sufficiently sensitive to distinguish between the vowel sounds of human speech, and I might say the apparatus is being adopted for very much more delicate work than the measurement of motor cycle exhaust noises.

I am not aware that any tests have been made with the audiometer other than those with which I am familiar, but if you will examine the photographs in *The Motor Cycle* itself you will see that the sound is taken directly to the human ear quite apart from the photographic part of the apparatus. The very point of measuring noise by the ear drum through a variable trumpet audiometer, and apart from any photographic or electrical apparatus, was brought out by me when a similar apparatus was used in the A.C.U. Silencer Trials long before the war. The suggestion that this question of sensibility of the human ear is not receiving attention is therefore totally wrong, although as a matter of fact it is quite easy to make the instrument photograph the requisite sounds.

Many people seem to discuss the measuring of exhaust noises as though it were necessary to hold one's breath during the operation. This is far from being the case, as anything but a really sensitive instrument is needed to measure the unpleasant noises familiar to anyone who lives on a main thoroughfare.

As it happens a better method has been designed, and in order to be absolutely fair to everyone separate judges are to note the exact degree of offensiveness of the noise as was done in the A.C.U. silencer trials successfully conducted under the direction of Gen. Sir Capel Holden many years ago.

Also under the heading of the "English Six Days Trial," I see it suggested that the A.C.U. rules are too technical, and that deduction of marks should not be a matter of opinion. If exact marking is to be carried out without any more or less human agency, obviously more apparatus would have to be devised, and the rules would have to be far more technical and complicated if an exact deduction is to be given beforehand for every mishap which may occur.

Is it not far more just to leave it to a certain extent to a question of discussion? You will notice that the riders of machines will be able this year to discuss everything with the officials and to see that they are satisfied in every possible detail.

Whilst on the question of Six Days Trials I was interested to read again that no overheating troubles now occur in competition work.

This remark will seem very strange to anyone who stood on the Bwylch-y-Groes hill on the last Six Days held by the A.C.U.

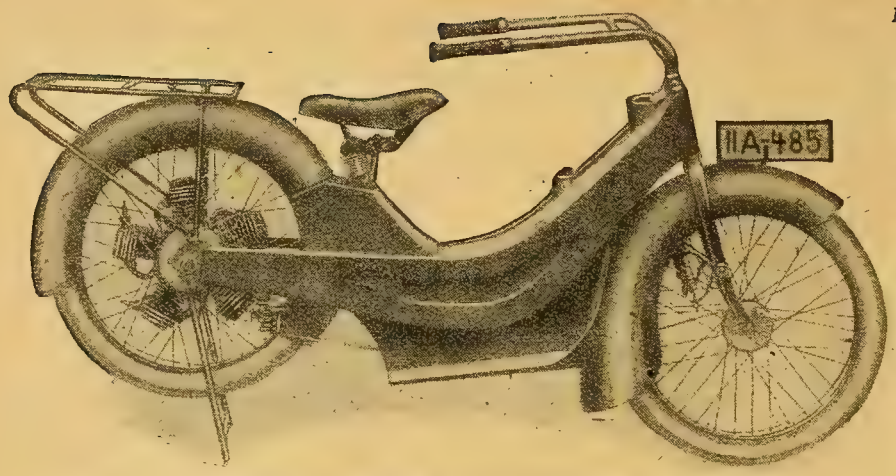
I also read that band brakes are always useless. The words "badly designed" are surely omitted here? I have a band brake on the front wheel of a 2¾ h.p. Wooler which, like everything else on the machine, is a pleasure to use.

I write this in no carping spirit, but merely as notes and an appreciation of your most interesting article,

A. M. LOW.

SOME NORTON EXPONENTS.

The Norton machine has two distinct reputations—first, as a big single for sidecar work, and, secondly, as a speedman's mount. The performances of the latter type in the T.T. races will long be remembered as an example of what can be done by standard machines in competition with special racing models. Above are seen some Norton exponents. Reading from left the riders are: Noel Brown, J. W. Shaw (who won *The Motor Cycle* Cup in the Flying Kilometre at Douglas), D. Brown, J. A. Walker, and F. C. North. Behind them stand D. R. O'Donovan, J. L. Norton, and W. J. Hassall.



A five-cylinder radial engine is embodied in the back wheel of a new German motor cycle. The drive is through a train of gears.

PUNCTURE-PROOF TUBES.

Sir,—I can thoroughly endorse your recent correspondent's remarks on puncture-proofed tubes, but the reason they are not already in universal use is the fact that they are mistakenly believed by the majority of motor cyclists to belong to the same class as the old sugar solutions we used to insert in the valve stem. The P.P Tube Company are also unwilling to proof one's own tubes at present, and some motor cyclists hesitate to scrap their existing tubes, which may be quite good, before being convinced of the practicability of the P.P. tube. That they will eventually become "standard practice" I am quite convinced. The next best precaution is to buy a Schrader tyre pressure gauge, and to use it. I use both, but am uninterested in the firms otherwise. T. S. SHARRATT.

113 M.P.G. WITH A SCOTT.

Sir,—Recently I noticed in "Occasional Comments" by "Ixion," that Scott merchants on the Island are doing big things, especially Captain Vinter's engine, which gives him five extra miles to the gallon if the plugs are fitted to the heads of the cylinders.

I am inclined to think that this is not *all* he could do, if he only went the right way about it; I have for some considerable time been getting thirty extra miles to the gallon, because I have fitted a Degory carburetter. With the plugs in the cylinder heads, I have been able to get 106 to 113 m.p.g. The 106 I got with 40 and 50 mile runs, and the 113 with a straight run from Chelmsford to Stockbridge, in Hants. This included fifteen miles of London traffic, and was accomplished in 4¼ hours, which shows a fairly high average speed.

I may state now that I find the Degory carburetter suits the "supposed petrol drinker" better than any other type I have tried. NOT INFALLIBLE.

Chelmsford.

OVERALLS.

Sir,—Your correspondent "Ixion" and others have been greatly exercised over the difficulty of keeping their overalls from leaving dirt on their trousers when they take them off. I have suffered long from the same trouble, and the solution may be useful to others. I may say that I visited all the London stores in the hope of getting something to meet my need, but failed; finally I wrote to Messrs. Barbour and Sons, of oilskin fame, asking them if they would make me a pair of seatless trouser overalls in their grey-green oilskin to fasten right up the side and so cure the trouble. They replied to the effect that they did not think that the seatless style would be successful, but they would readily make me a pair in the seated style to fasten right down the outside of the leg at the moderate price of 38s. 6d.

Needless to say, I ordered them, and they have now arrived, and there is every promise that they will be a complete success. SATISFIED.

Dunstable.

PLUG EFFICIENCY.

Sir,—Having just completed a tour of 800 miles, I think it only fair to bear testimony to the excellent performance of my machine—a 1919 B.S.A. with chain-cum-belt transmission, and a Sphinx D41 plug.

During the whole journey over all conditions of roads, and in fair and bad weather, I had no trouble whatever, and all hills were tackled with ease, though I used a heavy sidecar—136 lb. in weight without passengers and heavy luggage.

The plug was fitted early in May, since which time I have travelled over 1,100 miles on the machine, and it has not yet been necessary to examine it once, though previous to fitting it I was constantly being held up by an oily or overheated plug. Having obtained such excellent results I am quite sure I shall not try any other plug for my B.S.A. W. B. DOUGLAS.

WHAT IS HAPPENING TO THE TRADE?

Sir.—I was most struck with the editorial comments on the T.T. Race. It is quite certain to many of us that the abstention of leading firms from the T.T. Race was a mistake, and that next year there will be a desperate fight to regain laurels.

There is, however, another question which might be brought to light just now: it is the general attitude of the trade during this boom. There is a very self-satisfied spirit showing. Order books, etc., are all right, and so the idea of making friends of the rider is entirely being lost sight of. Many of the firms are losing sight of the fact that their position of favour is due in a large extent to the loyalty of the rider, who, at personal risk and with a most sporting instinct, has forced the development of the motor cycle to its present stage. Some of us have been through the mill from the start to now, and it is not a very happy state of things when old and tried riders find themselves treated with scant courtesy both by agent and manufacturer. Some of the young firms are quick to realise this, and the writer, who sees and talks to many competition riders, is struck with this. There is going to be quite a keen fight in this next year for top place, and it might be worth a lot to the manufacturers if a hint were given that they are losing old and tried friends just because the old-time courtesy is being lost sight of in the rush to sell machines.

Now the rider is much more an advertisement than the machine, for if a rider finds he gets generous and courteous treatment from even a less known firm, he is going to boom that make. I had a model example of that this week. An old and tried rider (not a shamateur, for he has paid for even the smallest item since the earliest days in full) was talking to me. He pointed out what a difficulty he had had in getting any decent treatment as to delivery; he had just made a visit to the firm whose make he has stood loyally by since the very first days of the motor cycle, and he had come away surprised at the scant treatment he got at his visit to the works. In former days he had been a welcome visitor always; this time he left feeling he was an outsider again, and for the first time in many years I found he was losing his loyalty to his favourite mount and the firm that made it. In fact, only a little—a very little—would make him at this moment cease to ride his old and favourite make and start in on a new make for his work and competition riding, and he is a well-known and tried rider with brainy ideas. What would be the result? Well, for it, as for his old mount, he would be a live advertisement wherever he went, with consequent results. Have the manufacturers thought of this? ONE WHO WATCHES.

Correspondents are urged to express themselves as concisely as possible, especially in view of the fact that only a small percentage of letters received can possibly be published. Many interesting letters are unavoidably omitted in consequence of their abnormal length.

CURRENT HAT

Times to Light Lamps.

July	24th	... ...	9.29 p.m.

A.C.U. Six Days.

This year's event will be limited to 150 competitors.

Records.

Twenty more records were broken last week. This time by the Harley-Davidson, see page 103.

Australia makes Motor Cycles.

Several manufacturers of motor cycles are springing up in Australia. The machines generally follow American lines.

Gibbets.

Charles Harper—the historian of the road—writes on the fascinating, if gruesome, subject of gibbets in this issue. His interesting article will be found on page 98.

The British Motor Cycle Racing Club.

The first open meeting of the B.M.C.R.C. will take place on August 14th, and will be open to both cars and motor cycles. The car events will be organised by the Essex Motor Club.

Paris Policemen Motor Cyclists.

Following the example of many American cities, Paris is to have a force of motor cyclist policemen, whose machines will be fitted with speedometers. They will use these machines for the purpose of catching motorists who exceed the speed limit. Sidecars will also be used for the purposes of transport.

Welsh Championship Meeting.

A Welsh open speed championship meeting takes place on Penchine sands, Pembrokeshire, on August 18th. This is one of the twenty open events sanctioned by the A.C.U., and a large entry is expected because the venue is one of the finest natural speedways in this country. The organising secretary is Mr. John Jenkins, Nelson Hotel, Carmarthen.

Open Speed Trials at Chatsworth.

The clubs affiliated to the East Midland and Yorkshire centres of the A.C.U. have organised open speed trials to take place on the 7th of next month in Chatsworth Park. Entries close on Saturday, the 31st, and should be sent to Mr. J. Simmonds, 10, Cranmer Street, Nottingham. There are classes for all types of machines and events for both flying and standing starts.

Hill-climbing on Two-strokes.

Twenty-five times up the Old Wyche without an engine stop on a two-stroke lightweight constitutes a demonstration described on page 103.

Twopence a Mile.

After the August holidays railway travelling will cost 2d. per mile (third class). A motor cycle carries two persons for considerably less than this—and first class.

Going to U.S.A.

Mr. Arthur Butterfield, of Levis Motors, and Mr. C. A. Easting, of Easting windscreens, are off to America on the 18th prox.

Should Know Better.

One of our American contemporaries shows a sketch of a right-hand sidecar lifting on a left bend. The opposite result would happen, of course.

Hush!

There is to be a "silence" test in the A.C.U. Six Days Trial after all. Only one machine in each class will escape penalty—according to the preliminary regulations, a review of which appears on page 102.

Special Features.

THE SCOTTISH TRIAL FROM WITHIN.

A.C.U. SIX DAYS REGULATIONS.

NOTES FOR THE NOVICE.

For the Novice.

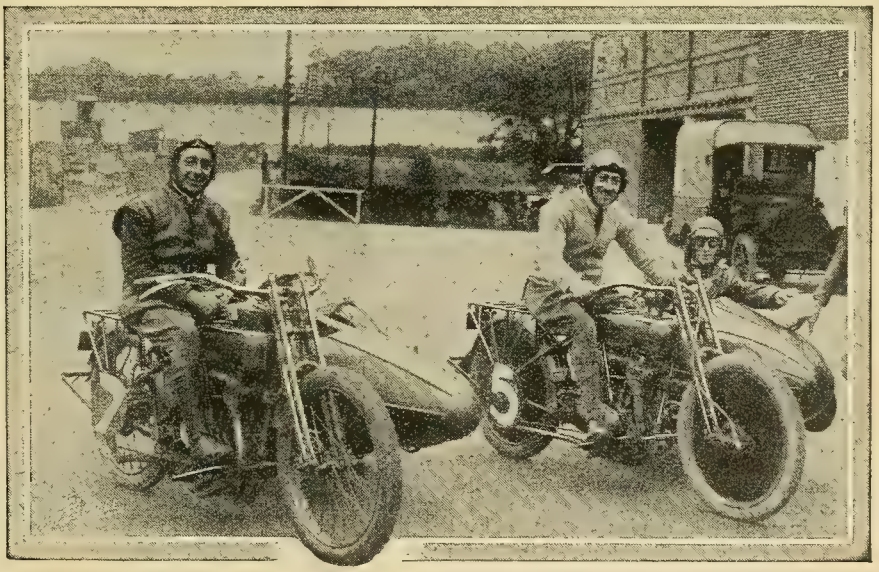
An instructive article on magnetos, specially prepared for the novice, is included in this issue (page 101), and is the first of a series of similar articles which will appear in subsequent issues.

An Inter-team Trial.

For next week-end the North-Western Centre A.C.U. are organising an inter-team trial for the "Blake Cup," starting from Town Hall Square, Bolton, at 11 a.m. on the 25th.

Machines for Nothing.

Some would-be motor cyclists seem to think that motor cycle manufacturers have machines to give away. The makers of the R.W. Scout recently forwarded us a letter containing the request for a free machine for advertising purposes from a rider in Wales. Not very long ago a Bishop made a similar request.

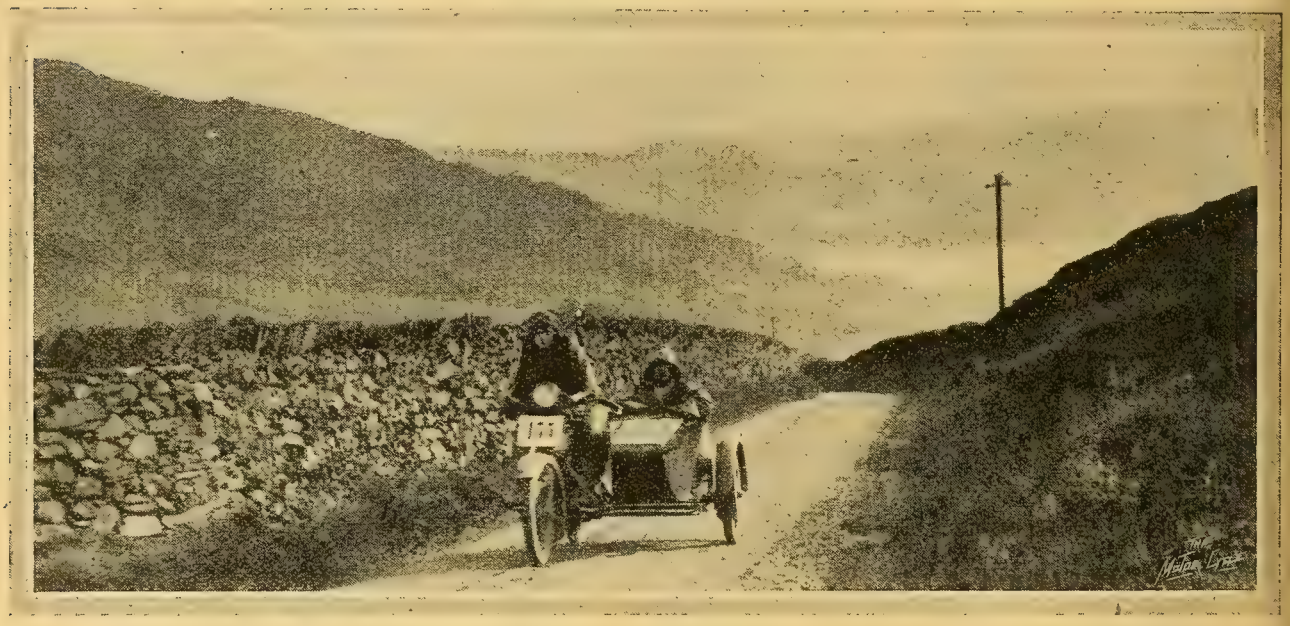


AMERICAN TWINS ON BROOKLANDS.

In addition to the records put up by J. D. Marvin and T. A. Sullivan on Tuesday of last week, other Harley-Davidson sidecars have distinguished themselves on the track recently. Above are shown J. A. Masters (No. 5) and E. Longman (No. 7), who finished first and second respectively in the 1,000 c.c. sidecar event at the last Brooklands meeting. Masters's speed was officially given as 57·8 m.p.h.

'MIDST LAKELAND HILLS.

The Cumberland County M.C.C. One Day Open Trial. Typical Lake District Weather Conditions encountered.



Half-way up Kirkstone, with Windermere in the distance. S. Parker (8 Enfield sc.) is changing up on one of the easier portions.

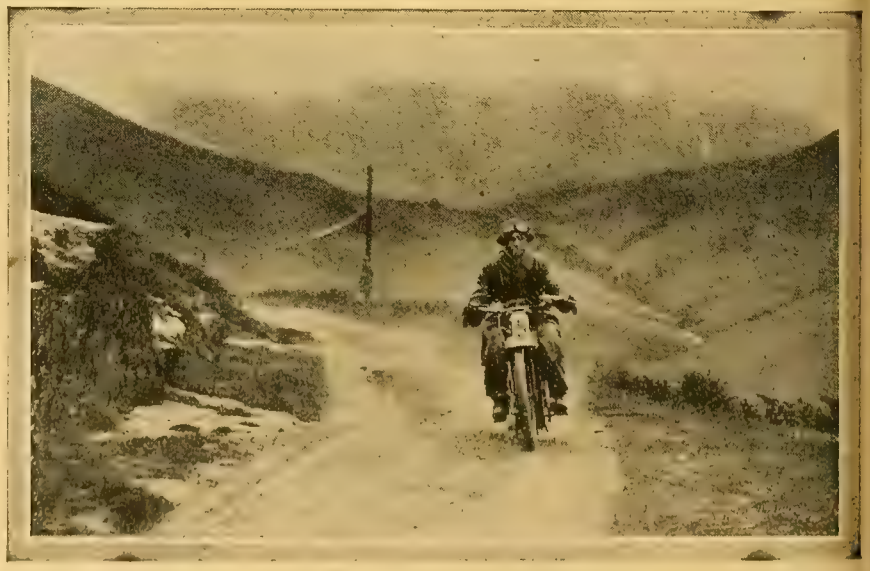
As organisers of an open trial the Cumberland County M.C.C. are perhaps a little lacking in experience, and the event which took place on Saturday last was, despite its sporting nature, somewhat long drawn out.

Another feature which might have been eliminated with advantage was the long main road run home and the comparatively easy sections early on the outward journey in the morning. This detail, of course, is due to the club headquarters being in Carlisle, which is an appreciable distance away from Lakeland proper. Had the run started from, say, Penrith, and ended at Pooley Bridge, there would have been time for the inclusion of some much more severe hill-climbing.

"A Wild Wan Morning."

Rain fell almost continuously during the preceding night, and the first man started out from the Crown and Mitre Hotel, Carlisle, at 9 a.m. in a steady downpour. The main Cockermouth road was followed for ten or eleven miles. Catlands, the first observed hill, was not a very severe climb, being a long winding ascent over a stony lane. A dense mist, however, obscured the view.

At Ireby, a sharp drop in the village led to a small watersplash, and then followed some very greasy lanes until the main road was rejoined, only to be left again by a sharp bend, for the second hill at Embleton Golf Course. This was rather trying, having a rough and slimy surface and one left-hand acute bend on a steep pitch. The soloists had no difficulty, however, but sidecars experienced a little wheel slip. From here good roads were followed to Cockermouth and the Lake Country was entered in real earnest. The weather showed signs of improving as Crummock Water was passed by the earlier competitors, and the rain ceased and the mist lifted as they climbed Buttermere Hause. This one-and-a-half mile climb caused very little trouble. The Sunbeams especially came up well but D. S. Alexander (7-9 Indian sc.) had a sooted plug, Ellison Hawkes (3½ Douglas) was in great difficulties, apparently suffering from faulty carburation and a stiff gear change. W. T. Tiffen (4¼ B.S.A.) made a splendid ascent, and J. W. Wills (2¾ Verus-Blackburne) came up well, doing a smart foot gear change on the top corner. Lower down the hill A. Boggis (4½ Quadrant sc.) caused some excitement by failing and running back, only just being saved from going over the edge of the road into the valley below. Of the lightweights R. Pape (2½ Clyno)



Buttermere Hause was wreathed in mist, which shrouded the distant mountain tops. The rider is G. W. Wilkin on his 2¾ h.p. Wilkin.

'Midst Lakeland Hills.—

made an excellent performance but just lacked the necessary power to get over the top, while J. Browne (2¾ Douglas) also had to foot-slog.

The drop down to Newlands required careful negotiation, as the roads were a mass of slime, and almost everyone was losing time. Near Keswick the third non-stop section commenced, and this was a twenty-mile run over grassy and greasy tracks, including a hair-raising descent and a watersplash. Everyone struggled on, however, and finished the morning's run in Keswick in good spirits, despite soaked garments and a plastering of mud which was so bad that new number cards had to be issued all round.

Towards Thirlmere.

A restart was made at 2.15, and a short distance out of Keswick the route ascended the hill to the left over some very greasy lanes, rejoining the main road a little further on. Towards Thirlmere the splendid surface and expansive view was enjoyable, as the rain had almost ceased. Away in the distance were patches of sunshine on the mountains. Descending Dunmail Raise, Grasmere was skirted and the road to Red Bank taken. The surface was not very slimy and was rapidly drying, but a hiatus occurred here as the necessary timing arrangements for the flexibility test were incomplete. In consequence, the competitors were delayed an hour at the foot of the hill.

The slow section of this test was on the steepest gradient and was very severe, After the fast section many competitors climbed the rest of the hill slowly and surely, but some continued at speed over the 1 in 4 at the crest. J. J. Dias (3½ P. and M.), who knowing the course romped round well ahead of time, was noticeable in this respect.

Of those who made excellent climbs the following deserve mention: H. W. Glendinning (3½ Sunbeam), steady; T. C. de la Hay (3½ Sunbeam), fast; J. W. Moffatt (4 Verus); and R. E. Darnton (7-9 Indian). J. A. Newman (3½ Sunbeam) came up imperturbably, and T. J. Stordy (2¾ A.J.S.) and G. W. Wilkin (2¾ Wilkin) both made fine ascents. T. M. Lawson (4 Harley) was very noisy, as was R. G. Lawson, who had special "silencing" arrangements on his Scott. I. H. Dickson (7 F.N.) came up in a cloud of smoke at a great pace; but F. Fieldhouse and E. A. Edwards on 3½ N.U.T. machines both footed when accelerating. In the slow section of the climb W. Kantlehem (3½ Wilkin sc.), S. Parker (8 Enfield sc.), and A. E. Pape (4 Triumph sc.) made excellent performances, and got away well, and J. E. Greenwood (3½ Sunbeam) also was exceptionally good.

Off the Route.

After leaving Red Bank many competitors went astray, but had they followed the excellent marking they would not have done so. Ullets Nest and Foolstep were two bad hills, although short, and on the latter T. C. de la Hay and D. S. Alexander came to grief. This non-stop section also included Kirkstone Pass—a gruelling climb after the day's adventures. Little trouble was experienced, however, and there were only two failures. Descending to Patterdale was no test of brakes after the drop down Blea Tarn Pass, which came earlier in the section, and everyone was able to gain some lost time on the main road run of thirty miles to Carlisle. Near Pooley Bridge, T. Rutherford (3½ Sunbeam) had a fall, and was somewhat severely damaged, and G. Dance sportingly retired to render assistance, while J. C. Coney (3½ Wilkin) had a seized engine near the same place.

Nearing the Finish.

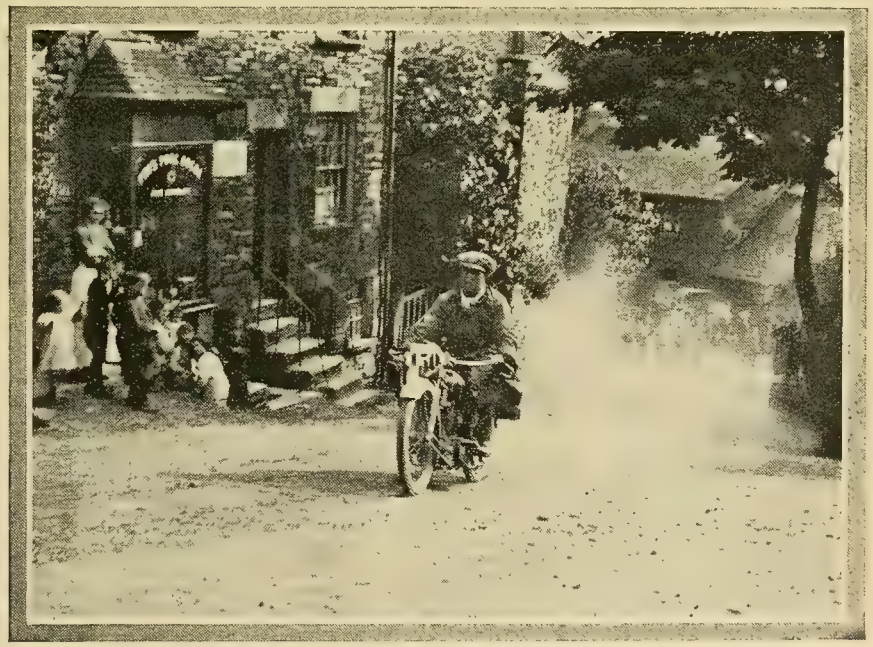
Possibly due to "blinding" along the main road, several competitors were in trouble between Penrith and Carlisle. The most exciting incident was when H. J. Birch (Le Zèbre light car) shed a wheel at speed. He, nevertheless, finished in time. The Richardson friction-driven cycle cars all passed at a great rate, endeavouring to finish within their time allowance, which they did, thus being the only complete team of one make to finish.

The following is a list of starters; an asterisk marks those who retired.

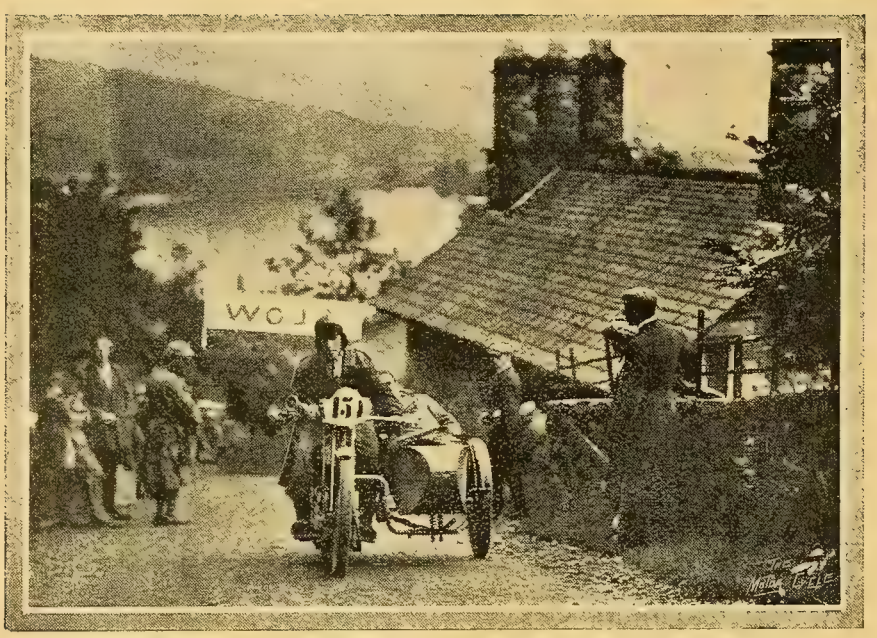
J. J. A. Dias (3½ P. and M.).
H. W. Glendinning (3½ Sunbeam).
F. O. Huntrods (3½ Ariel).
T. C. de la Hay (3½ Sunbeam).
*John C. Coney (3½ Wilkin).
D. S. Alexander (7-9 Indian sc.).
*Herbert W. Crampin (2¾ Wilkin).
*Alan Douglas (3¾ Scott).
Eric Williams (3½ Sunbeam).
*Arland Ussher (5 Brough).
Rupert E. Darnton (7-9 Indian).
J. Wallace Moffatt (4 Verus).
T. J. Stordy (2¾ A.J.S.).
J. A. Newman (3½ Sunbeam).
G. W. Wilkin (2¾ Wilkin).
*T. Rutherford (3½ Sunbeam).
G. Gray Barnard (3½ Sunbeam).
T. M. Lawson (4 Harley-Davidson).
*G. Dance (3½ Sunbeam).
R. G. Lawson (3¾ Scott).
W. Westwood (4 Triumph).
W. G. Harrison (3½ Sunbeam).
*Ellison Hawkes (3½ Douglas).
B. Hill (3¾ Scott).
W. T. Tiffen (4¼ B.S.A.).
Jas. Browne (2¾ Douglas).
J. Westwood Wills (2¾ Verus).
I. H. Dickson (7 F.N.).
Wilfred Marley (3½ Lea-Francis).
E. A. Edwards (3½ N.U.T.).
Stanley Bell (3 A.B.C.).
A. Ferris Morton (4 Harley-Davidson).
D. H. Watson (3½ Rover).
*John G. Hartley (2¾ Douglas).

The first part of the course was covered in a blinding rainstorm. H. W. Glendinning (3½ Sunbeam) in the watersplash at Ireby; he is followed by the T.T. winner T. C. de la Hay (3½ Sunbeam),

*E. Eldon Lightfoot (2½ British Excelsior).
Richard Pape (2¼ Clyno).
*William Myers (2¼ Ivy).
*W. A. Muncaster (2¾ Sun Vitesse).
R. Lamley Williamson (3½ Norton).
David Robb (3½ N.U.T.).
Fred Fieldhouse (3½ N.U.T.).
*W. C. Thompson (3½ N.U.T.).
W. Kantlehem (3½ Wilkin sc.).
*W. A. Fell-Smith (8 Blackburn sc.).
A. E. Pape (4 Triumph sc.).
Stanley Parker (8 Royal Enfield sc.).
G. W. Shepherd (4 Norton sc.).
J. H. Tiffen (8 Matchless sc.).
B. S. Tatham (7-9 Harley-Davidson sc.).



An unfamiliar view on Kirkstone Pass. The steepest gradient is at the foot, amongst the cottages of Ambleside, between which F. Fieldhouse, on his 3½ h.p. N.U.T., is passing.



A. E. Pape (Triumph sc.) in the slow section of the flexibility test on Red Bank Grasmere can be seen below.

J. E. Greenwood (3½ Sunbeam sc.).
•John Shields (8 Sunbeam sc.).
B. Jeffreys (4 Norton sc.).
T. Blain Westmorland (7-9 Harley-Davidson sc.).
•A. Horrocks (10 Morgan).
J. Leo. Shaw (10 Morgan).
H. J. Birch (8 Le Zèbre).
E. Richardson (9 Richardson light car).
R. G. McEwen (9 Richardson light car).
J. L. Roy Jenson (7-9 Harley-Davidson sc.).
H. M. H. Deeley (4 Triumph).
C. E. Richardson (9 Richardson light car).
A. H. G. Boggis (4½ Quadrant sc.).
George Townend (3½ P. and M.).
•J. C. Boyd (6 A.J.S. sc.).
R. W. Loughton (3½ N.U.T.).

NOTES.

The Lake District is undoubtedly the rainiest corner of England, and oilies, racing helmets, and sou'-westers were the order of the day until the lunch stop.

High averages cannot be maintained in the winding, stone-walled lanes of Cumberland and Westmorland, although the dalesmen can take some apparently blind corners at speed with safety; a knowledge of local topography is useful. J. J. Dias, who carried "No. 1," simply T.T.'d the course, and stopped outside each control to clean his machine in true P. and M. fashion.

In contrast, most of the other machines were smoothered in mud which the riders allowed to remain until the trial was finished.

MOTOR CYCLISTS AS OUTRIDERS TO THE KING.

RECENTLY, the Isle of Man, famous as the home of the T.T. races, was honoured by a visit from their Majesties the King and Queen, who were accompanied by Princess Mary and the Home Secretary, Mr. Shortt, K.C. As there are no mounted police on the Island, the Chief Constable requested the assistance of a number of the best known motor cyclists to help in clearing the roads of the Island and also the crowded streets. These six motor cyclists met the Royal party in Ramsey when they disembarked and rode in front of the special Daimler cars all the way to Douglas and then round the Island, visiting Castletown, Peel, and all the villages on the way. They kept a few lengths ahead. Douglas Brown was in charge, and in the towns they travelled in file and in the country in pairs, with one at the back to keep touch with the pilot car. The arrangements worked well, and the motor cyclists received a message of appreciation for their voluntary services both from the King's Equerry and from the Chief Constable, while the Home Secretary stated that he expected that motor cyclists, now that they had shown what they could do in this way, would be asked to repeat their work in other places. This is the first time that motor cyclists have acted in this manner for the King. The other cyclists were G. Brown, H. Barlow, H. Rylance, G. Trustrum, H. Lay, and A. Hogg.

NEWCASTLE & DIST. M.C. RELIABILITY TRIAL.

THE White Cross Insurance Association added additional interest to the Newcastle and District Motor Club's reliability trial by presenting a trophy—in the form of a handsome silver rose bowl to be won outright—for the best performance. A 204-mile route, *via* the old Roman road to Carlisle and on to Penrith, was planned. The Crown Hotel, Penrith, was chosen as the lunch stop for the fifty-seven competitors, comprising cars, light cars, and motor cycles.

From Penrith the course lay over Kirkstone, and then on to Kendal, Brough, Barnard Castle, Durham, and Newcastle, the first man being timed in at the latter hour at 8 p.m. The Newcastle Club is composed of prominent agents and manufacturers' representatives in the North of England. Consequently, most of the competing machines represented the latest productions from both English and American factories. Five gold medals were awarded to cars whilst four were carried off by motor cycles, Geo. Middleton, on a Harley-Davidson sidecar, carrying off the White Cross trophy.

DUBLIN M.C. HILL-CLIMB.

AN open handicap hill-climb was held by the Dublin and District Motor Cycle Club on Saturday afternoon, over a distance of a third of a mile at Cornell's Court, Co. Dublin. J. W. Shaw, of Belfast, on a T.T. Norton, was the actual scratch man. He received the distinction of fastest time, but he was only sixth over the handicap, which resulted in a tie between a Henderson and a 3½ Rudge. The times were as under:

	H'cap time. secs.
G. Thompson, 8-10 Henderson (scr.) ..	28¼
G. Griffin, 3½ Rudge (2 secs.)	28¼
F. Holmes, 3½ Rudge (2 secs.)	29⅝
J. A. H. Waters, 2¼ Diamond (14 secs.)	29⅝
C. W. Johnston, 7-9 H.-Davidson (scr.)	30⅜
J. W. Shaw, 3½ Norton (owes 4 secs.) ..	30⅜
R. Humphreys, 2¼ Velocette (14 secs.) ..	30⅜
G. Bewley, 3½ Norton (2 secs.)	32¼
H. Ellerker, 2¼ Douglas (11 secs.)	34
J. R. Boyd, 8 Sunbeam (scr.)	34⅜
H. McAllister, 2¼ Triumph (14 secs.) ..	34½
J. McGrath, 2¼ Velocette (14 secs.) ...	35⅜
J. A. Doyle, 3 A.B.C. (5 secs.)	35½
R. G. Millar, 2¼ Verus (7 secs.)	35½
H. Potterton, 3½ Norton (3 secs.)	38⅜
R. Nesbitt, 4 Douglas (3 secs.)	38½
W. Wilhelmj, 2¼ Bradbury (7 secs.) ...	39⅜
W. F. Robinson, 2¼ Excelsior (17 secs.)	40⅜
J. Chapman, 2¼ Levis (14 secs.)	41
E. J. Mecredy, 3½ Scott (3 secs.)	41⅜

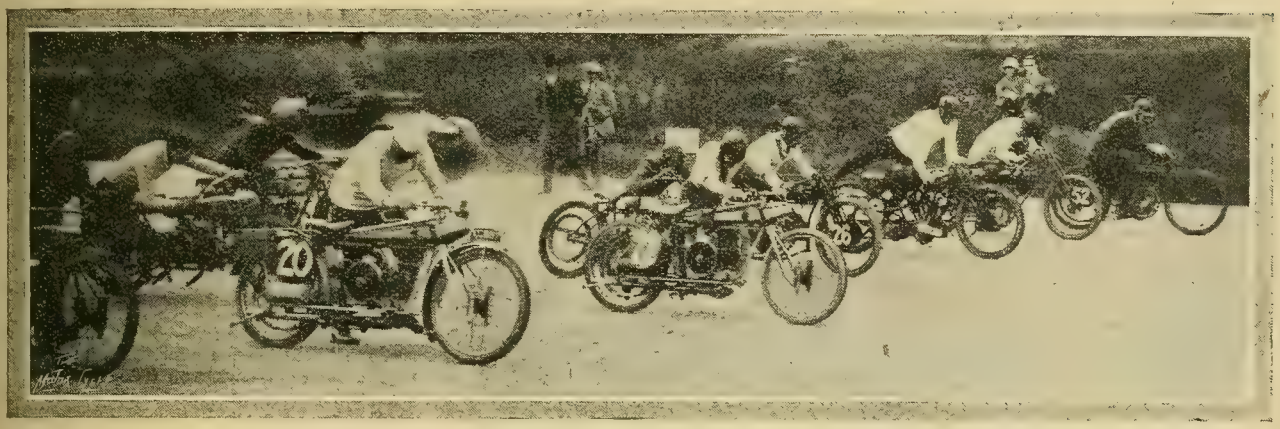
A LONG RUN FOR A TINY ENGINE.

QUITE a good unofficial run was recently made on a B.S.A. lady's model bicycle propelled by a Simplex motor attachment manufactured by the Patrick Engineering Co., Brearley Street, Birmingham. The run was carried out by Mr. A. G. Goldsmith, of the X Motor Cycle Co., of Torquay, who informed us that his petrol consumption worked out approximately at 130 miles per gallon. He covered the distance from Torquay to Birmingham, which is approximately 200 miles, at an average speed of fourteen miles an hour. With the exception of a few yards on the worst hills encountered, the little engine carried him right through without pedal assistance, and he neither opened his toolbag nor changed a plug.

Fitted with a Runbaken magneto, the attachment weighs only 26 lb., and the unit has a miniature single-cylinder two-stroke engine lying in a horizontal position on a special aluminium carrier, which also supports a countershaft plate clutch, which is gear driven.

The British Motor Cycle Club Meeting.

A Well-organised Programme of Racing. Two Records Broken.



Start of the ten miles scratch race for machines under 350 c.c. E. B. Ware (No. 28, 2¾ N.U.T.-J.A.P.) is seen mounting his machine.

WITH each event run absolutely to schedule, and with each race finishing at the fork where the spectators could note without the aid of powerful glasses the progress of each lap, the B.M.C.R.C. meeting last Saturday proved how interesting a Brooklands race meeting could be made.

One of the features of Saturday's racing was the triumph of the single lever carburetter. It has often been argued that better results should be obtained with the two lever variety, in speed work at any rate. Notwithstanding this, single lever carburetters brought success to the winners of the first, second, fourth, and fifth races.

It was unfortunate that only two starters appeared for the first event, the ten-mile scratch race for motor cycles with sidecars not exceeding 500 c.c., but the five other ten-mile scratch races were well supported on the whole.

The two starters in Event 1 were E. Porter (A.B.C.) and W. R. Brown (3½ Sunbeam), of these the rider of the smaller machine had the race his own way from the outset and increased his lead on each lap. Result :

	Time.
1. E. Porter (3 A.B.C.)	11m. 11⅕s.
2. W. R. Brown (3½ Sunbeam)	—

The winner's speed was 53.63 m.p.h.

Event 2 provided eight starters, and a casual glance at the machines showed several items of interest. Baragwanath, the winner, who, though a consistent supporter of B.M.C.R.C. events has never won before, used a Zenith, equipped with an overhead valve J.A.P. engine fitted with a car type Zenith carburetter. Sawer, riding the "X" (American Excelsior), had an ingenious foot controlled oil pump. The first, second, and third men all used one lever carburetters. F. W. Barnes employed both a Flexi, the carburetter designed by Messrs. Jones and Marchant, and a two-lever Amac.

Sawer, on the "X," who made the best start and acceleration, was using his clutch instead of being pushed off like the others. On their first appearance at the fork the order of the competitors was : Baragwanath (Zenith), Barnes (Zenith), Harveyson (Indian), Sawer ("X"), Chater-Lea (Chater-Lea), Dequin (Zenith), Bond (Zenith), and Watson-Bourne (Zenith). At the end of the first lap Baragwanath was followed by Barnes, Harveyson, and Sawer. In the second lap Baragwanath again increased his lead. Barnes, who apparently suffered plug trouble, retired, so that Harveyson took second place, while Sawer was third. The leader won by about a mile. Result :

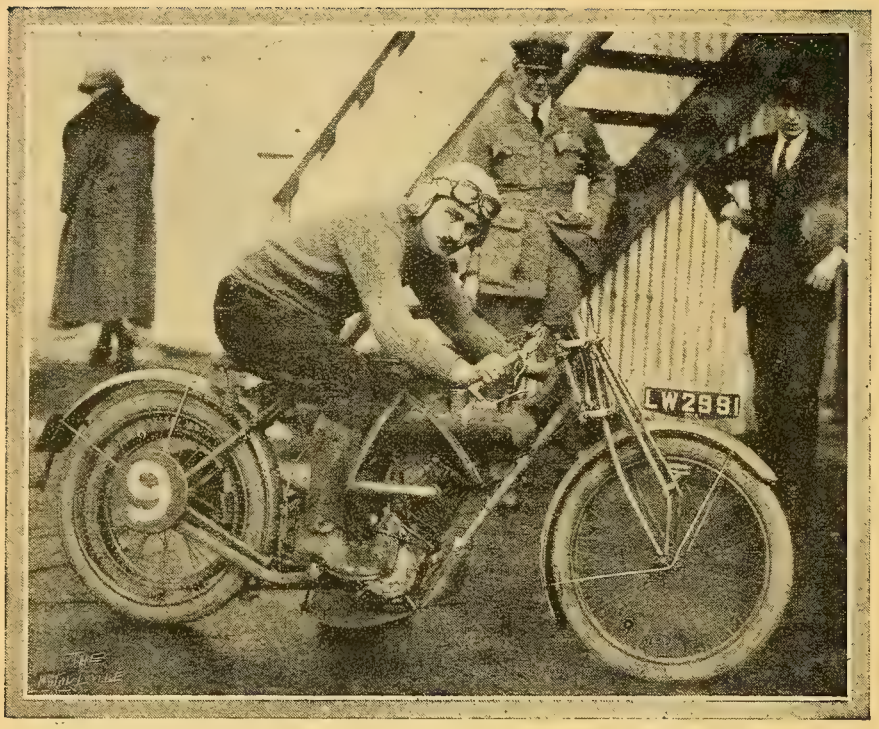
	Time.
1. E. C. E. Baragwanath (8 Zenith-Jap) ..	9m. 48s.
2. G. L. Sawer (7-9 American X)	—
3. H. R. Harveyson (7-9 Indian)	—

The winner's speed was 61.22 m.p.h. This beats F. W. Barnes's record made 13th September, 1913 ; time 10m. 21⅕s., speed 58.78 m.p.h.

Event 3, ten miles scratch race (Class B) for motor bicycles with engines not exceeding 350 c.c., saw the accomplishment of another record, this time in Class A, by G. J. McIntosh (one-cylinder Singer, 274 c.c.), who covered the ten miles in 11m. 35⅘s., speed 51.74 m.p.h. The previous best was W. A. Jacobs (one-cylinder Singer, 65 × 75 mm., 248 c.c.) ; time, 11m. 42s., 51.40 m.p.h., July 25th, 1914. Jacobs competed in this race, but his luck forsook him, as in the previous Saturday's meeting. Ware, who was riding an N.U.T., had a valve cotter carry away, and had to retire. McNab was mounted on a very smart looking Wooler, while McIntosh's Singer had rubber pipes con-

THE PRELIMINARY CANTER.

Riding down to the starting line. E. B. Ware (2¾ N.U.T.-J.A.P.) is seen on the extreme left, and McNab, the Wooler exponent, in a white jersey, behind him. A. Watson (2¾ Douglas) is in the centre, and G. J. McIntosh (2½ Singer) on the right.



Harry Martin (3½ Matchless-M.A.G.) makes a re-appearance on the track.

necting the crank case releases to the main air inlet of the carburetter so as to convey the waste oil to the engine.

At the end of the first lap T. Thompson (Douglas) overhauled E. B. Ware, whose engine was missing fire, just opposite the timekeeper's box, and after them came Watson, Longden, Hull, McNab, and Henry.

Despite his trouble, Ware got ahead of Thompson in the second lap, only to be passed again by the Douglas rider at the fork.

		Time.
1.	Tudor Thompson (2¾ Douglas)	1om. 45⅘s.
2.	G. J. McIntosh (2½ Singer)	* 11m. 35⅘s.
3.	E. Longden (2¾ Dot-Jap)	—

*Record Class A. Winner's speed 55.8 m.p.h.

There were two interesting Douglases entered for the Class C ten miles scratch race for motor bicycles up to 500 c.c., both of them had overhead inlet valves. Of these Bailey's mount had cast iron cylinder heads, while Thorpe's engine had aluminium cylinder heads. Martin (Matchless M.A.G.) employed a Claudel-Hobson one-lever carburetter, which brought him home to victory.

At the end of the second lap S. L. Bailey shed his belt, and A. Miller (Matchless) retired. The leaders all came past in a bunch in the following order: Martin, Emerson, Harveyson, and Kennedy. The veteran Harry Martin rode a splendid race. Result:

		Time.
1.	H. Martin (3½ Matchless)	8m. 53⅘s.
2.	H. R. Harveyson (3½ Indian)	—
3.	J. Emerson (3 A.B.C.)	—

The winner's speed was 67.47 m.p.h.

After leaving the start in the 750 c.c. scratch race Porter (A.B.C.) was leading, followed by Horsman (Norton), and Gayford (Zenith), an interval, then Chawner (Sunbeam), Davidson (Harley-Davidson), and finally S. L. Bailey whose Douglas was firing on one cylinder only. In the last lap Porter still further increased his lead, and the order remained unchanged. Porter was lapping at 73.23 miles an hour. Result:

		Time.
1.	E. Porter (3A.B.C.)	8m. 20⅘s.
2.	V. E. Horsman (3½ Norton)	—
3.	V. Gayford (6 Zenith-Jap)	—

The winner's speed was 71.88 m.p.h.

Next came the last of the ten-mile scratch races (up to 1,000 c.c.). Only five machines materialised, and of these Sawer's "X" broke a chain on the way to the start. Remington (N.U.T.-J.A.P.) was well away at the start, and led throughout. He was followed by Baldwin (Matchless), Garrett (Indian), and Newnham (New Imperial), who did not appear again. In the second and third laps the order did not change, but Remington forged further ahead.

		Time.
1.	E. Remington (8 N.U.T.-J.A.P.)	7m. 57⅕s
2.	O. Baldwin (8 Matchless)	—
3.	S. F. Garrett (7-9 Indian)	—

The winner's speed was 75.44 m.p.h.

The all-comers' three-wheel three-lap handicap was well supported, and resulted as follows:

		Start.	Time.
1.	H. Jepson (8 Zenith sc.)	1m. 3s.	8m. 6s.
2.	J. Chater-Lea (8 Chater-Lea sc.)	1m. 51s.	—
3.	C. Crossthwaite (5-6 James sc.).	3m. 3s.	—

The winner's speed was 60.09 m.p.h.

The final event was the all-comers' motor cycle handicap, distance three laps. The limit men, Longman, Henry, and McNab, all on Woolers, had repassed the starting line before the scratch man, Garrett (Indian), had been sent off. Result:

		Start.	Nett time.
1.	Violet Longden (2¾ Douglas)	3m. 39s.	9m. 21⅘s.
2.	A. Watson (2¾ Douglas) ...	3m. 39s.	—
3.	F. A. McNab (2¾ Wooler) ..	4m. 18s.	—

The winner's speed was 52.27 m.p.h. The first eight men finished within threequarters of a minute.

Lightweight Makes Fastest Time on Stile Kop.

A Hill-climb for Members of the Sutton Coldfield and North Birmingham A.C.

AN excellent half day's sport was provided by the Sutton Coldfield and North Birmingham A.C. last Saturday when several thousand motor cyclists journeyed to Stile Kop for the club members' hill-climb. Competitors in the motor cycle events were run off in pairs on the knock-out principle.

In the 250 c.c. class, G. Kuhn (Levis) beat F. Whitworth (Cedos) in the first round, and Newey (Levis) proved faster than F. Wilkinson (Cedos), while J. Johnson (Massey-Arran) secured a place in the second round by beating C. H. Hanwell (Cedos). This brought Kuhn (Levis), Newey (Levis), E. Smith (Cedos), and Johnson (Massey-Arran) into the second round, which resulted in wins for Newey and Johnson, who met in the final, the Levis rider taking first place, his time being 60⅕ secs.

A similar process of elimination was followed in the 300 c.c. event, Porter and Pugh, both on Levis machines, meeting in the final. The former won, his time being 57⅗.

Fastest Time of the Day.

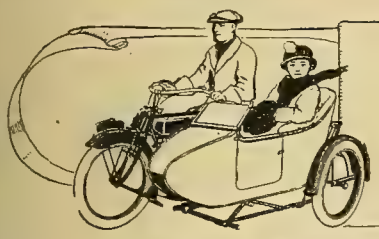
H. R. Davies, on his T.T. A.J.S., carried off the 350 c.c. class against Boston on a similar machine. In this event he made fastest time of the day, 46 secs.

The 560 c.c. event brought out some very "hot stuff" Nortons. The second round winners proved to be Boston (A.J.S.), Walker (Norton), Hassall (Norton), and W. E. Smith (Norton), while the third round resulted in a win for Walker, the event finally being won by Hassall (Norton), who also secured first place in the 750 c.c. class from Smith (Norton). In the unlimited class, however, Hassall had a partial seizure while going well, which gave the event to A. W. Thrush (Triumph).

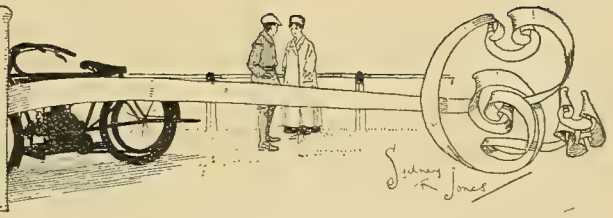
H. R. Davies (2¾ A.J.S.) also carried off both the sidecar events, his fastest time being 57⅗ secs. at a remarkable speed for so small an engine propelling a sidecar. A G.N. cycle car, driven by H. R. Godfrey, made fastest time in the two car classes included in the programme, its time being 51 and 50⅗ secs., the next best being G. Bedford (9.5 racing Hillman), who did the course in 55⅕ secs. in both events.

THE GRAND PRIX.

Three British entries have been notified for the Grand Prix of Le Mans, which is to take place on August 27th and 28th. These are D. S. Alexander and E. Kickham on 3½ Douglas and E. B. Ware (Morgan).



Activity in Clubland



Results of Speed and Reliability Trials organised by Provincial Clubs.

A Stiff Derbyshire Course.

The Loughborough Club recently held a trial over a sporting 120 mile course, including some of the stiffest country in Derbyshire. The route followed was to Ambergate Church, with a stiff non-stop section to Crick (lunch stop). Thence to Gorsey Bank, another severe climb, many failures occurring on the sharp gradient immediately beyond the watersplash. From Gorsey competitors proceeded to Green Hill, at Wirksworth, where many fine performances were witnessed. In the afternoon two exceptionally steep gradients—Riber Hill and Rowsley Bar—had to be negotiated, and on the first of these many competitors found their Waterloo. The club is indebted to members of the Mansfield and North Derbyshire clubs for their assistance in acting as marshals and observers. The following awards were made :

GOLD MEDALS, full marks.—W. Hadfield (4 Triumph), W. Chapman (6 A.J.S. sc.), and P. Strong (4 Norton sc.).

SILVER MEDALS.—Two stroke Class: H. J. Woodgate (2½ Clyno), E. Heggs (2½ Hobart). Four-stroke Lightweights: E. A. Evans (2½ Verus), A. Wadlock (2¾ New Imperial). Unlimited Solo: A. Roberts (4 Verus), H. S. Harvey (4 Blackburne). Sidecars: N. Dowland (7-9 Harley sc.).

One Retirement Out of Sixteen.

With three observed hills on a circuit of twenty-six miles, ridden three times in a sporting reliability trial held recently, by the Ilkley Motor Cycle and Light Car Club, only two riders out of sixteen failed to make clean ascents of each hill. Two of the observed hills, Beamsley Beacon and Snowden Bank, failed to eliminate any of the riders, and the only failures were at Church Bank at Blubberhouses. Here the difficulty lay in a sharp right hand turn at the foot of the steepest portion which prevented any approach at speed.

The route lay over the hilly country between the Washburn and the Wharfe, but, despite its hills and awkward corners, despite the trouble with sheep on the moorland ways and chars-à-bancs on the main roads, it was only by resorting to the timing for consistency riding that the various decisions were reached. Of the sixteen riders only one failed to complete the course.

H. W. Sellars (Calthorpe) won the President's Cup for the best individual performance, and the gold medal for the best sidecar or runabout performance. This, in spite of a puncture and the breaking of a water joint which cost him nine minutes on the last circuit. W. F. Scott (3¾ Scott) won the gold medal for the best solo performance. The certificate winners were as follow :

SOLO.—275 c.c., W. Reed (2½ Sparkbrook); 350 c.c., E. H. Webster (2¾ Diamond); 500 c.c., F. P. Denton (3½ N.U.T.); 750 c.c. and over, W. F. Scott (3¾ Scott).

SIDECAR.—750 c.c., C. A. Barker (3 Enfield); 1,000 c.c., H. W. Sellars (Calthorpe).

65 m.p.h. with V Twin.

The Westmorland M.C.C. held some very successful speed trials recently at Lowther Park, Lord Lonsdale's north country seat. The course, which was just over half a mile in length, had a splendid surface, and quite satisfactory times were made. The fastest time of the day was made by Hugh Mason (N.U.T.), who completed the course in 28 sec., at an average speed of 65 m.p.h. Several riders had narrow escapes at the bends, but fortunately no accidents occurred. In the solo classes many riders felt that they could have managed higher gears, but with the sidecars the experience was the reverse, the long pull at the finishing post being a strain on most of these machines. It will be observed the V twins won every event but that for 550 c.c. sidecars. The results were as follow :

350 C.C. CLASS.—1, Hugh Mason (N.U.T.), 32s.; 2, B. Houlding (Douglas), 36s.; 3, T. Lightbody (2¾ Douglas), 37½s.

550 C.C. CLASS.—1, Hugh Mason (N.U.T.), 28s.; 2, H. Russell King (A.B.C.), 29⅘s.; 3 (tied), J. Whalley (A.B.C.) and Guy Jeffreys (Norton), 30⅘s.

750 C.C. CLASS.—1, Hugh Mason (N.U.T.), 29⅘s.; 2, H. Russell King (A.B.C.), 29⅘s.; 3, J. Whalley (A.B.C.), 29⅘s.

UNLIMITED CLASS.—1, S. A. Marks (Indian), 29⅘s.; 2, J. Whalley (A.B.C.), H. Mason (N.U.T.), and H. Russell King (A.B.C.), all tied—30s. each.

In the deciding race Mason finished the course in 28⅘s., whilst Whalley occupied a second longer and Russell King came in third with 30s.

550 C.C. SIDECAR CLASS.—1, M. Parkinson (Norton sc.), 44s.; 2, W. G. Harrison (Sunbeam sc.), 45s.; 3, R. M. Chaplow (Scott sc.), 50s.

UNLIMITED SIDECAR CLASS.—1, S. A. Marks (Indian sc.), 36⅘s.; 2, R. O. Hodgson (Norton sc.), 38⅘s.; 3, Bryan Jeffreys (Norton sc.), 38⅘s.

A T.T. Winner Declines Award.

The official results, on time and formula, of the flying half-mile speed trials, held by the Worcester M.C.C. on the Gloucester Avenue, Madresfield Court, were as follow :

TIME.

Gold medal for fastest time of the day.—H. G. Cullis (2¾ Douglas). Eric Williams actually made the fastest time on his special Tourist Trophy machine, but in true sporting spirit retired, leaving the award to Cullis.

Scooters.—P. W. Barker, first-class certificate.

350 c.c.—H. G. Cullis (2¾ Douglas), first-class certificate; J. Westwood Wills (2¾ Verus) and M. Holland (2¾ Sudbrook), second class.

500 c.c.—C. L. Whatley (3½ Norton), first class; H. Moule (3½ Rudge-Multi), second class; R. W. Wickham (3½ Rover), third class.

750 c.c.—R. W. Wickham (3½ Rover), first class; H. C. Cullis (2¾ Douglas), second class; H. Moule (3½ Rudge-Multi), third class.

Unlimited c.c.—H. Moule (3½ Rudge-Multi), first class; F. Drew (3½ N.U.T.), second class; H. G. Cullis (2¾ Douglas), third class.

Passenger, 500 c.c.—M. Hadland (2¾ Sudbrook), first class.

Passenger, 750 c.c.—M. Hartland (2¾ Sudbrook), first class; H. Moule (3½ Rudge-Multi), second class.

Passenger, 1,000 c.c.—M. Hartland (2¾ Sudbrook), first-class; H. Moule (3½ Rudge-Multi), second class.

Passenger, unlimited c.c.—B. Bladder (8 New Imperial), first class; M. Hartland (2¾ Sudbrook), second class.

FORMULA.

Class 1.—P. W. Barker (Scooter), first class.

Class 2.—H. G. Cullis (2¾ Douglas), first class, H. Woodhall (2¾ Douglas), second class.

Class 3.—H. G. Cullis (2¾ Douglas), first class; C. L. Whatley (3½ Norton), second class; J. Westwood Wills (2¾ Verus), third class.

Class 4.—H. G. Cullis (2¾ Douglas), first class; J. Westwood Willis (2¾ Verus), second class; R. D. Wickham (3½ Rover), third class.

Classes 5 and 6.—H. G. Cullis (2¾ Douglas), first class; J. Westwood Wills (2¾ Verus), second class; R. W. Wickham (3½ Rover), third class.

Class 8.—O. K. Bevington (3¼ Sunbeam), first class.

Classes 9, 10, and 11.—M. Hartland (2¾ Sudbrook), first class; O. K. Bevington (3½ Sunbeam), second class.

Comparatively few clubs are able to hold local speed trials owing to the difficulty of obtaining a suitable speedway. The Nottingham and Dist. M.C.C. are fortunate in this respect. Competitors lining up for the start at the successful meeting held in Bestwood Park, the seat of Sir Frank Bowden. For results see "Club News" page.

CLUB NEWS.

Week-end Club Events.

July 24.—Sheffield and Hallamshire M.C.C. Bisley Trophy.
July 22.—Eastern Valley M.C.C. Wye Valley to Newport.
July 24.—Westmorland M.C.C. Fixed Gear Trial.
July 24-25.—Birmingham M.C.C. Run to Chepstow.

July 29.—Eastern Valley M.C.C. Secret Run.

Club News.—

Romford and District M.C.C.

It has been decided to form a motor cycle club under the above title, for Romford and District, open to all interested in motor cycling.

Particulars may be obtained from the hon. sec., George T. Carter, 37, Mildmay Road, Romford.

Marlow and District M.C.C.

An enjoyable run was recently held to Hampton Court and Bushey Park, but was somewhat marred by the weather. The club has accepted the invitation to participate in a rally organised by the North London M.C.C., to take place on August 8th, and it is hoped that all members will endeavour to turn out on that date.

Rochester, Chatham, and District M.C.C.

On August 2nd, the above club will hold a gymkhana on the Mathematical Ground, Rochester Esplanade, in aid of St. Bartholomew's Hospital. All motorists and motor clubs within reach are invited to enter, and a good programme has been arranged; there will be no entrance fees, and competitors can enter the majority of the events on the field. Prizes will be given for each event. All enquiries should be made to the hon. secretary, Mr. S. White, 34, Maidstone Road, Rochester.

Taunton and District M.C.C.

The reliability trial from Yeovil to Land's End, recently promoted by the above club, attracted sixty-two entries from the following clubs: Taunton, Yeovil, Dorchester, Sidmouth, Bournemouth, and Exeter. Fifty-seven competitors faced the starter and most of these completed the course.

Rain fell until Exeter was reached, and the going in places was very heavy. The two observed hills, Holne Chase and Newbridge, caused most of the competitors to lose time, but this was recovered before the next check. Thirteen machines failed to negotiate Holne Chase without assistance, and five had to be assisted up Newbridge. Results:

HARRISON HOTEL CUP, for best team performance.—Yeovil M.C.C. team, who lost no marks, and whose total error in time was 30s. The team were: P. W. Moffat (3½ Douglas), G. E. H. Fletcher (3½ Zenith), and M. D. Stirling (4 Triumph sc.).

SOLO PERFORMANCE.—1, P. W. Moffat (3½ Douglas); 2, G. L. Morrish (3½ Rudge). The following also completed the course without loss of time or marks: S. Goodman (4 Douglas) and F. Hewin (6 Bat).

LIGHTWEIGHT.—1, E. Wood (2½ Scale); 2, F. A. M. Dodd (2¾ Coulson-B).

SIDECAR.—1, P. Pike (3½ Coventry Eagle sc.); 2 (equal), M. D. Stirling and C. Taylor (both 4 Triumphs). The following also completed the course without loss of marks or errors in time: H. A. Pickson (6 A.J.S. sc.) and I. F. Anderson (7-9 Indian sc.).

SPECIAL PRIZE.—L. A. Comfort (2¼ Triumph).

York and District M.C.C.

The second annual reliability trial from York to Edinburgh and back, organised by the above club, will be held on August Bank Holiday. Starting from York Minster at 12.1 Sunday midnight, the coast route will be followed to Edinburgh, and competitors will be due back at midnight on Monday, August 2nd. All classes of motors from scooters to cars are eligible to enter, and valuable cups will be awarded in the various classes. The trial hon. secretary is Mr. F. E. Wasling, 22, Blake Street, York.

Northern M.C.

In lieu of a badge the above club has adopted a green pennant. The name of the club is embroidered thereon in gold, and a special attachment is included so that the pennant can be affixed to the number plate.

In spite of adverse weather, a most successful run to Whitby was recently made, the club leaving Newcastle on the Saturday and returning the following evening.

Stamford and District M.C.C.

At a recent meeting of motor cyclists in Stamford a new club was formed entitled "The Stamford and District Motor Cycle Club," with headquarters at the Crown Hotel, Stamford. In order that activities might be commenced as early as possible, the officers of the club were appointed by those present, who all signified their intention of becoming members. All interested in the formation of the club, which will have social and sporting events every week-end, are invited to communicate with the hon. secretary, H. L. Simpson, Brockenhurst, 4, Emlyn St., Stamford.

Nottingham and District M.C.C.

The results of the speed trials held recently in Bestwood Park were as follow: Class 1, under 500 c.c., solo on forumla: 1st G. W. T. Hartwell (3½ Norton), 2nd Reg. Lucas (3 A.B.C.), 3rd H. Russell (3½ Brough). Class 2, over 500 c.c., solo on formula: 1st G. W. T. Hartwell (3½ Norton), 2nd H. Russell (3½ Brough), 3rd N. C. Saward (3½ Rudge). Class 3, unlimited passenger machines in formula: 1st G. W. T. Hartwell (3½ Norton sc.), 2nd H. R. S. Birkin (D.F.P.), 3rd D. R. King (4 Norton sc.). The fastest times were made by H. Russell (3½ Brough) 29 3-5 secs., G. W. T. Hartwell (3½ Norton) 30⅖ secs., and Reg. Lucas (3 A.B.C.) 32⅖ secs.

Birmingham M.C.C.

The results of the Birmingham M.C.C. reliability trial to Llangollen and back, a report of which was published recently in *The Motor Cycle*, were as follow:

WINNERS OF GOLD MEDALS FOR BEST PERFORMANCE IN THE VARIOUS CLASSES: G. Denley (2½ Velocette), H. O. Hayes (3½ Sunbeam), J. H. Walker (4 Triumph), W. T. Woodcock (3½ Ariel sc.), F. W. Giles (6 A.J.S. sc.), and G. T. Baragwanath (4 Triumph).

SILVER MEDALS: W. Bown (Bown-Villiers), H. J. Egginton (3 Enfield), H. C. Jennens (3½ James), B. Kershaw (3 Verus), E. H. Seymour Tye (3½ Rover), W. A. Egginton (3½ Sunbeam), R. F. Cooke (4 Triumph), T. C. Bowen (4 Triumph), H. H. Peters (4 Triumph), H. Davies (4¼ B.S.A.), A. E. Rollason (3½ Ariel sc.), R. E. Pugh (2½ Levis sc.), J. G. Orford (2½ New Imperial sc.), A. H. Edwards (4¼ James sc.), E. W. Winkle (6 A.J.S. sc.), W. E. Emery (4 Rex sc.), T. F. Watson (4 Norton sc.), H. H. Timson (4 Triumph sc), H. H. Saddington (5-6 James sc.), H. Boynton (5-6 James sc.), H. P. Cutler (5-6 James sc.), H. A. Pattman (4 Norton sc.), and H. Riley (6 A.J.S. sc.).

BRONZE MEDALS: J. Buckley (2½ Velocette) and A. H. Haden (2½ New Comet).

North-west London M.C.C.

Owing to the fact that old North West London Motor Cycle Club has resumed its activities, the newly founded club with this title is changing its name in order to avoid any possible chance of confusion.

On the 25th inst., a gymkhana and flying meeting is being arranged for at the Central Aircraft Co.'s Northolt Aerodrome. The new name of the club will be announced as soon as a general meeting has decided on this.

With regard to the original North West London Club, activities were suspended only on account of the war, and, as many members have been scattered over the Empire, no active work has been undertaken until recently, when all members have had full opportunity of returning home.

The hon. sec., Mr. H. J. Pooley, 23, Clifton Avenue, Finchley, N.3, would like all old members to communicate with him.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Fitting New Valve Guides.

Being desirous of fitting two new valve guides to my B.S.A. engine, will you please tell me (1) if I shall experience any difficulty in removing the existing guides? (2.) Is there any fear of fracturing the cylinder? (3.) In fitting new guides, will they fit so well that I shall have no trouble with the faces of valve and pocket? I shall procure B.S.A. guides, and, being a skilled mechanic, though not possessing any machine tools, wondered whether I shall have a disappointing result.—E.M.

(1.) It is unlikely that you will have any great difficulty in removing the valve guides. (2.) If the guides do not come out with gentle tapping, it would be advisable to arrange some form of drawing tool, using a long bolt and nut and a bush, and then there will be no danger of cracking the cylinder. (3.) The new guides should be a perfect fit when received from the makers.

Enfield Gear Adjustments.

(1.) My machine is fitted with Enfield gear, and I have covered about four hundred miles on it. How do I oil the gear without taking off the aluminium chain cover, as there seems to be no special injecting orifice provided except one for oiling the chains near the engine-shaft? (2.) Should I require to dismantle the gear, etc., must I remove gear handle and rod if I take off the cover? If so, please inform me as to the correct method of removing. (3.) How is the tension of the gear chains adjusted? Should they be slack? Is it better to leave them fairly slack?—W.C.

(1.) Lift the gear handle against the spring, and turn it away from the pinion over which it fits. This latter can then be lifted out and the orifice filled with oil, which will soon make its way into the gear, when the pinion can be replaced. (2.) To dismantle when new, cam is required to be brought into action, take off cap, turn handle to extreme low gear position, take out the small screws round gear cover, and remove this; the three-cam operating piece can then be withdrawn. This should not be necessary for many months. (3.) The chain adjustment of front chains is controlled from the right-hand side. Loosen nut in quadrant and loosen lock ring; the countershaft barrel can then be rotated and front chains adjusted. Do not have them too loose, but, what is more important, there must be no tight spot.

Noisy Driving Chain.

Can you tell me (1) how to silence the screech of the countershaft chain on a 1919 2½ h.p. Sparkbrook? The chain has always been noisy. It sags about ¼in. when pressed down. Is that the correct tension? (2.) After riding the machine I get oil on my left leg. Where can I buy leg shields to stop this, or can you suggest some better method?—G.M.

(1.) The noise arising from the driving chain is probably due to wear between the rivets and the rollers, and we cannot suggest any cure if this is so. We take it, of course, that the chain is not rubbing against any stationary part of the machine. Perhaps the condition of the chain would be improved by allowing it to soak in a mixture of melted grease and graphite for a few hours. (2.) There are no shields on the market such as you require. It should be quite easy to improvise one, however, from sheet steel or aluminium, securing it to the footrest or footboard.

Legal Action Inadvisable.

I should be much obliged if you would give me the following information. I purchased a B.S.A. outfit, recently advertised, giving £100 for it. The side-car was leaning slightly over towards the machine. I remarked about this to the owner, and he said it was set like that. Going out on the outfit in the evening of the day it was bought, I noticed it leaned more when rounding corners, so I examined the chassis and found that one of the connections was broken, the parts being quite rusty. Can I make the late owner pay for repairing it?—R.R.

Unless the machine was sold to you under a definite guarantee as being in perfect condition, there is very little possibility of your obtaining satisfaction from the late owner. In any case, the amount involved in the repair of the broken connection would be so comparatively small that it would not be worth while incurring legal expenses in recovering it.

ONE OF THE WORST HILLS IN THE SCOTTISH TRIALS.

Kenmore was conquered by all competitors but ten, and considering the atrocious surface and bad bends the performances were good. A solo rider using both feet on the corners.

A Racing Engine.

I am thinking of rebuilding a small one-cylinder engine (350 c.c.) with o.h. valves, and I should be very glad of your advice on the following points: (1.) What compression ratio would you advise, remembering that this engine is to be used *solely* for short sprint work, and is to be very adequately cooled? (2.) I intend to use the cams from a 1920 6 h.p. J.A.P. engine (as I rather think the valve-contour will take some beating). What valve timing do you suggest? I shall be able to plot out the exact timing chosen, but once fixed, I shall not be able to depart from it. (3.) Is the ideal sprint engine suitable for speed-hill work, gear ratio being carefully studied, of course? —S.S.D.

Without definite knowledge of the design, we cannot give you the ideal compression ratio: it would probably lie between 80 or 90 lb. per square inch. If you intend using the valve cams from a J.A.P. engine, you cannot vary the timing other than by altering the shape of the contact faces of the rockers. The actual timing, of course, largely depends upon the design of the cylinder, the induction and exhaust passages, and the valve areas. You might try the following: inlet valve opens top dead centre and closes 10° after bottom dead centre. Exhaust valve opens 45° before bottom dead centre and closes 5° after top dead centre. A high compression, high efficiency, engine would be the most suitable for short speed hill-climbs.

Economy, Speeds, and Lubrication.

(1.) What are the most economical speeds of single-cylinder four-strokes in general? (2.) Would a hot air intake reduce fuel consumption to a sufficient degree to make it worth the trouble of fitting it? If so, how could I arrange it on my 4 h.p. Triumph, having a Triumph semi-automatic carburetter? (3.) Is it advisable to run at a slower speed (on top gear) than 12 m.p.h.? If I close the throttle to run at a lower speed the engine labours and snatches badly at the transmission. (4.) What are the immediate signs of under lubrication? It is rather a bugbear to me in case oil might not be reaching the engine all unknown to me, and I want to know the first thing to look for. (5.) What is "knocking" exactly? What is it that actually happens to cause that metallic ring? Is it harmful to the engine? Ought not closing of the air lever, and/or retarding spark immediately to stop it?—M.J.

(1.) Your query is not quite clear. The maximum efficiency of the internal combustion engine used on motor cycles is obtained at a fairly high number of engine revolutions. At low speeds the power output, in proportion to the fuel consumed, is not so good as it is when the engine is revolving at from 1,800 to 2,200 r.p.m., but in ordinary running you will find that the overall economy of the machine is best at from 20 to 25 m.p.h. (2.) It is very unlikely that a warm air intake would appreciably reduce the fuel consumption of your machine. (3.) It should be possible to run on the level at about 9 or 10 m.p.h. on top gear, but it is really much better to change into second gear than to attempt to do this for any distance. (4.) If the engine is badly under-lubricated, the power will fall off, the cylinder will become unduly hot, and the engine will knock when under heavy load or when accelerating. You should have no uneasiness with regard to the delivery of oil to the engine, as the resistance of the oil in the pump can be felt when the plunger is depressed. One pumpful per six or eight miles normal running should suffice. (5.) Knocking or konking is the result of the spark occurring too early in the compression stroke for the particular engine speed at the moment. The noise is caused by the hammering of the bearings as the flywheel forces the piston against the increasing pressure of the exploding gases. The spark should be retarded before the engine commences to knock and the air lever should be closed slightly.

READER'S REPLY.

A Technical Question.

If "E.W.B." requires maximum power at low speeds I would suggest that he adopts the following valve timing: exhaust to close between 30° early and top dead centre; inlet to close between 30° early and bottom dead centre. The opening positions may be disregarded.—J.T.B. (Colne).

SPARKLETS

The Ilkley Trial.

H. W. Merrall, who rode an A.B.C. in the Ilkley trial, has been awarded a third-class certificate.

Stimulating Overseas Efforts.

A handsome silver trophy has been presented by the Leicester Rubber Co., Ltd., to their agents in Denmark, to be competed for in an annual trial in that country.

A Removal.

Burney and Blackburne, Ltd., wish to give notice that they have concentrated their administrative and selling departments at 38, Conduit Street, Regent Street, W.1, where all communications should be addressed.

More Lighting Dynamos.

We are informed by the makers of F.R.S. lamps that their new dynamos for motor cycles and cars are in an advanced stage, and will shortly be possible to give delivery of these.

Liverpool Garages.

Motor cyclists arriving late in Liverpool will find the city inhospitable in the way of garages. There seems to be no accommodation for motor cycles after business hours. We were recently compelled to take a machine across the Mersey, where, behind Hamilton Station, Horn's all-night garage was located.

About Carburetters.

We have received from Messrs. Charles H. Pugh, Ltd., Whitworth Works, Wilton Road, Birmingham, the latest booklet describing the 1920 Senspray carburetter, which should be of great value to Senspray users. Readers interested are invited to write to Messrs. C. H. Pugh for a copy.

Of Interest to Manufacturers.

The makers of a well-known make of carburetter are anxious to get into touch with a firm of manufacturers able to produce complete carburetters to the said firm's specification and drawing. Those interested should address letters, marked "Carburetter," c/o the Editor, *The Motor Cycle*, 20, Tudor Street, London, E.C.4, when they will be forwarded without delay.

A Norton Expert.

Mr. D. R. O'Donovan, the well-known exponent of Norton machines on Brooklands track, is shortly opening premises at 76a, Great Portland Street, London, W.1, where he will act as official repairer to, and agent for, Norton motor bicycles. He is undertaking to tune up a limited number of second-hand Nortons, and those who would like this work carried out should make early application. He is also contemplating taking up other agencies.

100% UP!

The Transport Ministry have notified the Railway Rates Advisory Committee that they desire to increase railway fares not later than August 1 in order to take advantage of the holiday traffic, and the Minister has requested the committee to let him have their recommendations some time before that date.

It appears that the committee will probably recommend an increase of passenger fares of 33 1-3 per cent. on existing rates, which will bring railway fares to exactly double what they were before the war.

The Minister of Transport desires to net a large revenue from the holiday-going public, as otherwise he fears it will be impossible to wipe off the deficit on this year's working.

Comfort in the long run

Speed, Power, Strength, and Comfort are moulded together in the building of the M.T. S. Type.
The Power Unit has an inbred love for speed and climb.
The Gears are simple, flawless—reliable.
The All-Steel Frame gives strength, and the entire machine is smart sound, and comfortable.
Bad roads, long hills, don't worry the M.T. rider—he's confident, comfortable, and secure.
The M.T. is the All-Purpose, All-Weather Mount, it should be *your* mount.

Norwell's 'Perth' Brogues

"Direct from Scotland."

For the links, the hills, the open country, the shore, there is no finer footwear procurable.
The sound principles of Scotch brogue-building are carefully adhered to by Norwell craftsmen working with the finest leather obtainable. Exclusive cut and distinctive smartness are as characteristic of Norwell Brogues as their durability and comfort. **The "Byng" (No. 50a).** Is a cleverly made shoe for gentlemen. Uppers of Zulu calfskin. Best butt leather soles, black & brown.

Special Clearance Price **47/6**

When ordering give name or number required.

Orders are sent post free in Britain, postage abroad extra. Should dissatisfaction arise the purchase money will be fully refunded.

CONFIDENCE

The joys of motor cycling will always be enhanced if the rider has complete confidence in the control of his machine.

If he FEELS safe his full enjoyment awheel is far more likely to be realised, and—

If his machine is equipped with "BOWDEN, Tyseley" Brake and Control Fitments he will BE safe and ready for the steepest hill or any emergency likely to be encountered on the road.

QUADRANT, Lawley St., BIRMINGHAM

From Manufacturer to Motor Cyclist.

The "Ramont" is ideal for touring or sporting wear.

The "RAMONT" is not a ready-made "fit-you-anyhow" Sports Coat, but is cut on prevailing West End lines to your own measurements. It is the ideal coat for touring or sporting wear and is equally suitable for Theatre, Gardening, or even those impromptu occasions when appearance is a paramount consideration.

30/- made to measure

Front and back of style 601.

Ramont SPORTS COAT

is made in a wide range of Sand Cloths, Yorkshire Tweeds, Herring Bone Tweeds, Donegals, etc., in Brown, Grey, and Heather Mixtures.

Prices from 30/- to 50/-.

TROUSERS can also be made to measure from the same material as the coat—making the "RAMONT" into a smart summer suit.

SOLD WITH A MONEY BACK GUARANTEE.

Don't send money—send for patterns. A p.c. will do (save postage) for full range of patterns, booklet and self-measurement form.

BECAUSE OF THEIR QUALITY

insist on

BELDAM

Inner Tubes

THE life of your tyre depends on the quality of the inner tube. Beldam Inner Tubes are of the highest possible quality. They are built up layer by layer from the finest sheet rubber. Beldam Tubes are extremely elastic, of great strength and toughness, and, if correctly fitted, will outlast your cover.

Get a Beldam InnerTube to-day and compare it with any others you are using. You will realise at once the superior quality of the Beldam and why it wears so long.

You get them in a Waterproof Bag

Every Beldam Tube is packed in a waterproof bag, which keeps it fresh and clean and free from damage until you want it.

All standard sizes made. Write for prices.

The Beldam Tyre Co. (1920) Ltd. Bentford, Mid'x.

THE MOTOR CYCLE

Insurance • Policy •

This space will be occupied week by week with copies of actual letters received from Policy holders who have had occasion to make claims. Full names and addresses will be supplied to any bona-fide enquirers.

Gentlemen,

I beg to acknowledge receipt of your favour of the 10th inst., and to express to you my sincere thanks for the very prompt and satisfactory settlement effected by you of the claim against me in respect of recent accident. I shall have much pleasure in recommending your Company to my motor-cycling friends.

Regretting that you should have had to meet a claim on a Policy so recently issued, and again thanking you for your attention,

Yours faithfully,

The only SAFE TEST of insurance is

Get Full Power from your Engine

BY USING

The "Service" Leather BELTING DELUXE

For years we have been supplying a belt that grips under all conditions, is not affected by wet, has no gap at the fastener, requires no tools for fitting, and is fastened in such a way that the fastener will not pull out.

ALL SIZES IN STOCK.

The Service Leather Belt can be supplied in all sizes from stock. Any length cut, and two fasteners given gratis with each belt. These fasteners have been specially designed for use with the "Service" belt. Eyelets to accommodate them are placed in the belt about every inch. The two ends of the belt are brought close together, and therefore the "Service" belt is particularly suitable for use on variable geared machines of the expanding pulley type. If you require a belt that will outlast three rubber belts, give no trouble, and transmit the full power that your engine gives, invest in a "Service" leather belt.

Keep this table of Prices

per foot handy. We can supply any of these sizes at all times.

TYPE.	WIDTH.				
	¾"	⅞"	1"	1⅛"	1¼"
Two-ply	3 0	4 0	5 0	5 6	6 0
Three-Ply	—	5 0	6 0	6 6	7 0
Four-Ply	—	—	—	7 0	8 0
Fasteners	6d.	6d.	8d.	8d.	8d.

Outlasts Three Rubber Belts

This is a good serviceable Belting. Strong, durable, and economical. An exceptionally good investment.

Come in and see us. We specialise in all Motor-cyclists' needs, and can supply you at once with the best quality at the lowest price.

The "IVY" TWO STROKE

Does a 2-stroke over 250 c.c. overheat?

NOT IF IT IS AN

IVY.

A.C.U. Officially Observed Trial, July 15th, 1920.

25

Consecutive Ascents (non-stop) of the Old Wyche Cutting at Malvern.

A

3 h.p. IVY 2-stroke

350 c.c.

Successfully carried out the above exceptionally severe test under the auspices of the A.C.U. The Old Wyche Cutting is one of the steepest hills in Great Britain, the gradient at the top being 2·8. The machine ran with wonderful consistency and completed the 25 ascents at an average speed of 18·75 m.p.h. The total distance was 40 miles and the time occupied just over 2 hours. The engine of this machine is our standard production for 1921.

A User's Testimony:—

Dear Sirs,

I am writing to tell you my opinion of your F.E.W. VALVE ATTACHMENT after a 600 mile tour during the Whitsuntide Holiday. The only feeling I have in regard to them is one of extreme satisfaction. I ran the whole distance on my 3½ h.p. Rover combination without the slightest trouble on one day alone doing something like 230 miles over very give-and-take roads and through several cities. My fuel consumption was about 85 m.p.g. which is 10 m.p.g. more than I have been able to get before and flexibility and power were much improved. I am very pleased with my investment, as in extra m.p.g. alone the Attachment will soon pay for itself.

Yours faithfully,
(Signed) T. GREGORY.

The Three-wheeled Runabout.

MANY words and much ink have been expended on the subject of sidecars versus runabouts, but there is a feeling in certain sections of the manufacturing world that in the near future the over-developed sidecar will find it difficult to justify its existence. Prices have risen, and are rising, until the list price of some fully-equipped big sidecar machines approaches that of a small car, and the public are beginning to ask how this can be so. There are, of course, and always will be, some who prefer to pay the top price for the very best outfit rather than a similar price for a cheap car, but, in general, the man who is prepared to lay out £200 and over expects more comfort and better protection from the elements than is afforded by most motor cycles. Taxation will probably handicap the development of the light four-wheeler, though the few firms who have already good selling propositions in this line will be sure to do well; but the three-wheeler is a simple and inexpensive proposition, and we dare prophesy that its development during the next few years will be extremely rapid. Undoubtedly the three-wheeler, as we now know it, has certain inherent disadvantages, but it provides proper protection for both driver and passenger, and, what is equally important, it can be produced as cheaply as, or cheaper than, a motor cycle and sidecar. The majority of high-powered sidecar outfits are never detached from the sidecar, and are clumsy to handle as solo mounts. Why, therefore, should heavy, unmechanical, and expensive couplings be introduced into the designs? From the one-piece motor cycle and sidecar chassis, it would be an obvious step to produce a simpler and more mechanical frame, even if well-tried motor cycle transmission were retained. A good market for the motor cycle and sidecar, and especially for dual-purpose machines, is assured, but we expect that the three-wheeler of the future will meet with considerable favour.

The A.C.U. Six Days Trial.

UNDOUBTEDLY there is a certain amount of enthusiasm among manufacturers regarding the A.C.U. Six Days Trial next month, and there seems to be every likelihood that the limit entry of 150 will be reached.

There was, however, a tendency among would-be entrants to criticise the new rule that observed hills would not be known to the competitors. It was thought that riders with a knowledge of the country traversed would have an unfair advantage, as a study of the route cards would convey to them a full knowledge of the hills likely to be observed.

It is an open question whether this new rule is entirely a wise decision, although, excepting for the point mentioned, there does not seem to be any great disadvantage. However, as we are able elsewhere in this issue to give a list of the worst hills in the trials, the A.C.U. has wisely, we think, removed a possible cause for complaint.

Sidecar Taxation.

IT will be recalled that the motor cycle taxation proposals include an impost on sidecar outfits of £4, irrespective of power and weight. We have frequently pointed out that this is distinctly unfair to those owners of machines under 200 lb. in weight, who attach a light sidecar for occasional use. A 200 lb. lightweight will be subject to a tax of 30s., and machines over this weight £3; therefore, to tax a lightweight sidecar £4 is to obtain £2 10s. for the sidecar, whereas the owner of a larger machine pays only £1 extra for the passenger attachment.

We are glad to be able to announce that efforts are being made to bring about an amendment by which sidecars will be taxed £1 separately, and that there appears to be every reason to anticipate that those who are watching motor cyclists' interests in this matter will be rewarded.

An index to the advertisements in this issue will be found on the page facing the back cover.

Occasional Comments by "Ixion"

Buying at a Distance.

I RECENTLY drew attention to the difficulties which surround the would-be buyer of a second-hand motor cycle who has the misfortune to reside at a great distance from any of the big agencies. A correspondent reminds me that the A.C.U. "consuls" are empowered to "vet" second-hand machines in return for a small fee, and that the employment of a consul solves the problem to which I alluded. The normal examination includes a general inspection and a road trial. For an increased fee, a certain amount of dismantling is performed.

Springing the Luggage.

ONE of my recent visitors—per two-wheeler—was an old pal who is too staid to profit by glad eyes along the road. His wife, I should add, is far too timid for pillion riding, and, incidentally, has a cycle car of her very own. He dismounted cautiously outside my garage, cocking his eye at a kind of Eiffel Tower erection on the carrier. I examined the structure incredulously, and found that it owed its height to the fact that a Tan Sad formed the first storey. "What the ——," I began. "Only way I can get the luggage to stop on over 1920 roads," he explained tersely. I kicked myself. The Tan Sad people should note this dodge with a view to extending their business. No, they need not send me one—I have a sprung frame.

Spare Chains and Tubes.

I RECENTLY counselled the reckless novice not to venture too far abroad without a spare chain and a spare tube. An ostensibly innocent greenhorn has hit me between wind and water by asking where and how he is to carry these necessities. On the spur of the moment I was about to pen eloquent reminiscences of days when motor cycles had capacious cupboards in the sides of their tanks, but I was fobbed off this subterfuge by another enthusiast who burst in, irate with a garage who had refused to split a two-gallon can, and imploring me to plead for the standardisation of three-gallon tanks. Seriously, there are plenty of spare tube carriers on the market, and up to a point they are excellent. That point is the occurrence of the puncture. Such a case must not be large enough to let the tube flop about, or it will chafe; consequently, the job of inserting the damaged tube in the tiny case is perilous to the morals of a hot, tired, dirty, and irritated motor cyclist. The punctured tube should, therefore, be tied round the waist until equanimity has been restored by a wee doch-an-doris, or other suitable prescription. But I am clean beat as to the proper method of carrying a spare chain. Personally, I fold mine in several thicknesses of stout paper, and strap the resulting annular (good word, that) parcel to my carrier. But then I do not carry flappers. Can anybody advise a sound dodge for carrying spare chains?

Where we Score.

I AM told that many externally keen motor cyclists inwardly hanker for the day when they will be able to afford a thumping big car. Let such console themselves and curb their impatience with sundry salutary reflections. Item, our narrow track enables us to pick out a fairly smooth line amidst the pot-holes of the modern road. Item, our narrow width permits us to overtake lorries and chars-à-bancs at sight, instead of having to hoot till our fingers ache and then wait for a wide place in the road. Item, we need not reduce our speed on hills. I have just had a jaunt in a colleague's light car, and a scooter was practically the only motor vehicle we met which could not pass us on hills; even the popular 500 c.c. sidecar outfits climbed about as fast as we did.

A Holiday Route.

DOUBTLESS a good many of our readers will travel West during their annual vacation. I should advise them to avoid the whilom popular route westwards from Exeter *via* Moretonhampstead to Tavistock. I was over it the other day, and for narrowness, sharp corners, and high hedges it is as prehistoric as ever it was, whilst its ancient dangers have been vastly enhanced by the lumbering chars-à-bancs which nowadays infest it. As the daily papers have recorded, a tragic smash occurred on it the other day. No great praise can be given to the surfacing of the alternative route *via* Okehampton and Launceston, which is also far less interesting, but the second route is at least moderately safe. There is, of course, a third and still more interesting route, viz., along the south coast of Devon to Ashburton, and on to Two Bridges. The north coast route has appalling surfaces in parts of North Devon, and is apt to be bleak when Cornwall is entered.

The Cynic at Large.

THE other evening it was raining in torrents—nothing new for an English July. Four of us sat and listened to the rain pattering. The afternoon's golf wouldn't bear talking of. Had we not been mopped up by a leggy individual who tackled an ultra-long course with a bag containing nothing more than (1) a dilapidated brassey, (2) a rusty mashie, and (3) an antique cleek cut down to serve as a putter? The cynic picked up the current issue of a famous motor cycle journal. After one of the weekly features (spare my blushes) had been ruthlessly dissected, he fell to analysing the T.T. advertisements, one or two of which ingeniously camouflaged the fact that the wares concerned had not been right down the course. Then he made venomous capital out of Brooklands, where "records are beaten with a bit up the man's sleeve, only to be won back as soon as they are broken, and where everybody rides with an eye on the handicappers, taking care not to win too easly or too often."

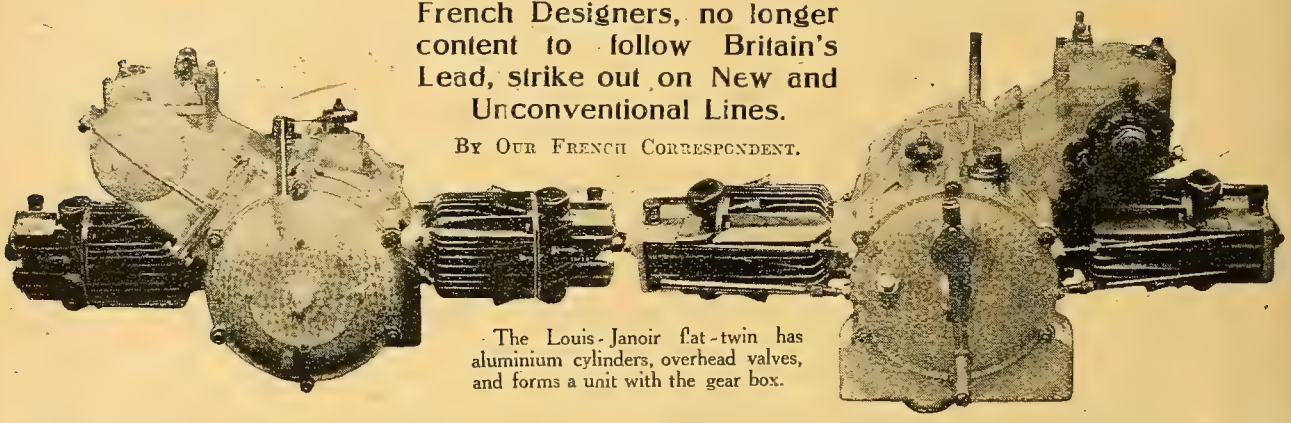
MOTOR CYCLE DESIGN IN FRANCE.

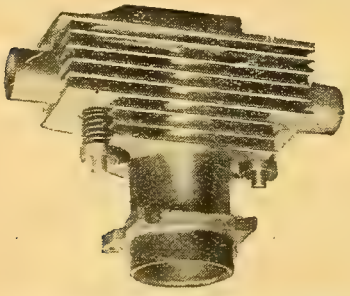
French Designers, no longer content to follow Britain's Lead, strike out on New and Unconventional Lines.

By Our French Correspondent.



The Louis-Janoir flat-twin has aluminium cylinders, overhead valves, and forms a unit with the gear box.

AFTER being stagnant for a number of years, French motor cycle design showed a wonderful revival at the last Paris Salon. On that occasion several machines were brought forth by new concerns and hitherto unknown engineers, in which were incorporated original ideas of such merit as to place them in a class by themselves. France had so long been content to follow timidly in the wake of England, in so far as motor cycle design and production was concerned, that the appearance of the new school created no little surprise among those who attended the show.



One of the T head cylinders of the Bleriot twin engine.

Machines on exhibition last October were nothing more than sample models. Nearly all of them were incomplete, and in the interval many details have been modified as the result of extensive tests on the road. At the present time, eight months after they were first shown to the public, some of them are ready to go into production, while others will still be several months before they are offered for sale.

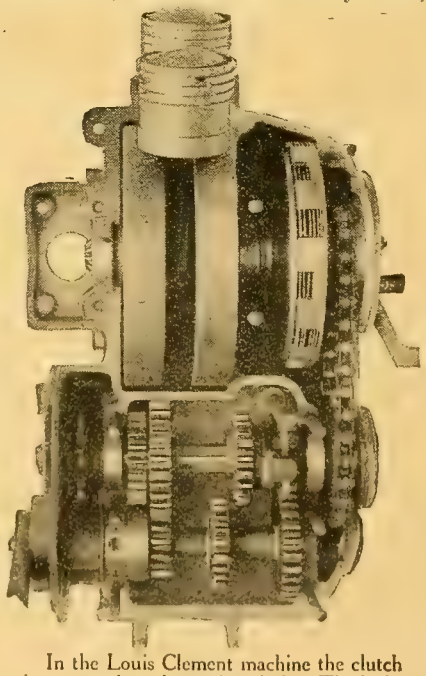
As the most typical of the new French design, the Louis Clement twin may be selected. The engine was designed and built by M. Calvignac before the war, and in a frame of quite ordinary design was in service throughout the hostilities. Improved and modified, it was placed on exhibition at the Salon, and after further modifications, made possible by modern production methods, it is ready to be offered to the public.

The outstanding feature of this machine is that the two cylinders, of 62 × 90 mm. bore and stroke, mounted at an angle of 55° on an aluminium crank case, have a common detachable head carrying the valves, the camshaft, the cam operating mechanism, and combining the intake and the exhaust manifolds. There is a detachable cover over the head, so that no moving parts are visible, and the whole of this mechanism runs in a bath of oil.

In addition to this feature, the engine and the gear box form a compact unit, which naturally tends toward lightness, as well as longevity, for all working parts are completely enclosed. As can be gathered from the illustrations, the drive is taken from the crankshaft to the gear box by a short, enclosed chain, and the final drive is taken to the rear wheel by a second chain inside a detachable housing. A spring hub assures a perfectly flexible drive.

Enclosed Drive.

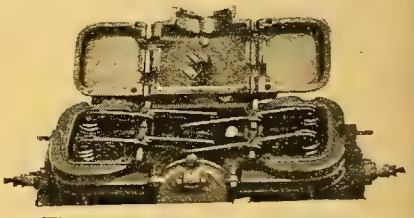
Reverting to the engine, the crank case forms a two-piece aluminium casting, divided horizontally, and forming two compartments, the front one enclosing the crankshaft, with its internal flywheels,



In the Louis Clement machine the clutch is mounted on the engine-shaft. The kick-starter is on the lay shaft of the integral gear box

the mutiple-disc clutch and the sprocket for the main driving chain. The rear compartment is a three-speed gear box, with sliding gears, and with sprocket for the final drive by chain. All the shafts are mounted in ball bearings. The pistons are of aluminium, and the I section connecting rods have roller bearing big ends. A bevel pinion on the extremity of the crankshaft drives an enclosed vertical shaft which operates the transverse camshaft in the detachable head.

There are four cams operating the vertical valves by means of very long rockers. One of the patented features of this engine is the simple method of adjusting the valve stem clearances.



The overhead valve mechanism of the Louis Clement V twin

The valve stem has a flat screwdriver type end, while the extremity of the cylindrical portion is threaded. A special nut with a flat head from which project two studs, screws on to the end of the valve stem, and also receives the forked end of the rocker. The fork, while operating the valve, also prevents the nut from turning To get adjustment, it is only necessary to lift the rocker clear of the valve and turn the nut in the required direction.

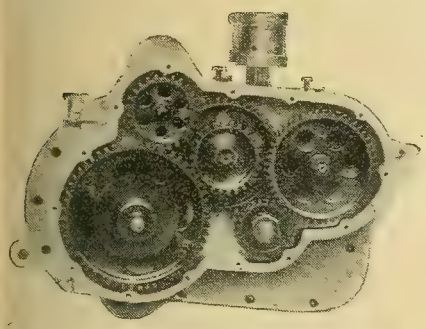
The detachable head, which is secured to the two cylinders by means of eight studs, has the intake and the exhaust passages cast with it. The carburetter, a horizontal Zenith, is thus bolted up direct to the head, without the use of any external intake piping. The main air supply is from two opposed points on the exhaust side of the cylinder head, passing right through it to the intake valves on the opposite side. This not only gives a uniform heating of the mixture, which tends toward economy and even running, but the cold air cools the oil bath forming a part of the head. As there are no plain bearings in the engine, drip feed is used from a tank to the detachable head, and by means of an overflow in this to the base.

Motor Cycle Design in France.—

chamber through the vertical shaft housing. The magneto, as can be seen, is placed on the top of the gear box, and driven by means of a horizontal shaft with bevel gearing. The engine, which has a piston displacement of 540 c.c., runs at 2,500 revolutions, at which speed it is declared to develop 8 h.p.

Steel tubes are only used to a limited extent by the Louis Clement engineers, and brazing has been done away with almost entirely. The front fork, for instance, is a steel stamping, carrying at its upper rear extremity a forged steering pivot. Front suspension is by means of a four-leaf spring shackled at its front end. Both spring and shackle work under ideal conditions, for they are enclosed in a metal housing which constitutes the front number plate. Pressed steel is also used for what is generally described as the top tube. In this case it should be described as the top frame member. It is in two parts, riveted together, and encircles and is welded to the head.

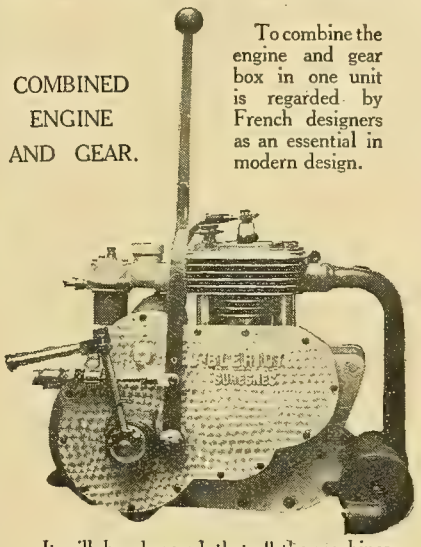
Demountable and interchangeable disc wheels are another very good feature.



Combined "half-time" and change-speed gear of the Bleriot side-by-side twin.

These are built up of a cast aluminium hub, forming brake drum, aluminium discs, and a steel rim. The rear wheel can be taken out, leaving the chain, sprocket, and brake bands in position, and either the front or the sidecar wheel can be put in its place. The advantage of this when it is necessary to repair a puncture on the roadside in bad weather will be fully appreciated by all practical motor cyclists. The front wheel brake is operated from the handle-bar by means of a Bowden wire. The rear wheel brake control is by means of a pedal operated by the left foot. When a sidecar is used, this is also braked by the left foot.

As there is no tube above the tank, the speed indicator and clock are recessed in this latter with very neat effect. A pressed steel tool box is fitted, the top of which forms a strong luggage carrier.

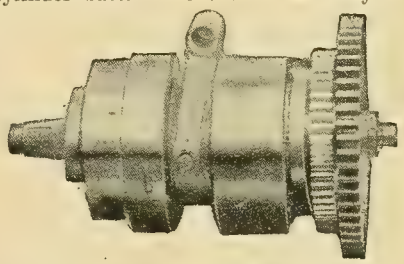


COMBINED ENGINE AND GEAR.

To combine the engine and gear box in one unit is regarded by French designers as an essential in modern design.

It will be observed that all the machines described in this article follow this practice. Above is depicted the Bleriot unit, showing the side-by-side cylinders, kick-starter, and gear lever.

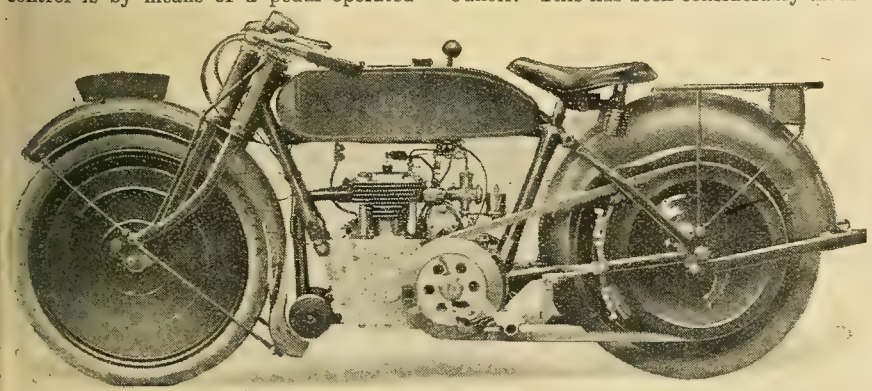
A machine of an entirely different type, but no less original, is the flat twin 8 h.p. Janoir. This has been considerably modified since it was first shown at the Paris Salon, the greatest change being the abolition of all steel tubes. The engine has cylinders measuring 85×85 mm. bore and stroke giving a piston displacement of 965 c.c. The crank case and the two cylinders are a single aluminium casting with pressed-in steel liners and a detachable cylinder head with cast iron valve seats. With this design there is no joint, and consequently no holding-down bolts at the cylinder base. The crank case is cylindrical, and is closed by two circular steel end plates, which on being removed give complete access to the internal organs.



The clutch unit of the Bleriot twin.

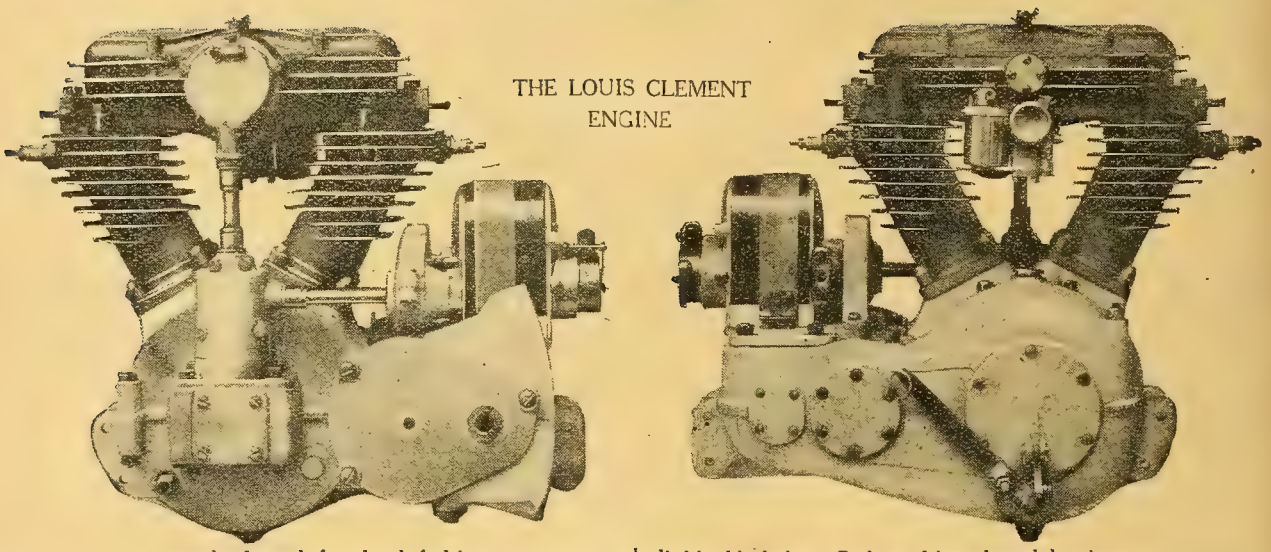
When the right-hand plate is taken off, for instance, it shows the skew gear-driven vertical camshaft, with its four cams, the drive at the lower end for the oil pump, and at the upper end for the high-tension magneto. The main supply of oil is contained in the aluminium sump, but there is also an auxiliary supply within a tank in the frame of the machine. The balanced crankshaft with its two throws at 180° is carried in ball bearings, and has connected to it tubular rods with split big ends. The gudgeon pins are hollow, and work in aluminium pistons with bronze bushings. It is declared that this engine gives off 11 h.p. at 2,000 revolutions, and 16 h.p. at 3,200 revolutions. No attempt will be made to get the highest power out of the engine, but rather to adopt a moderate compression and get a very flexible and smooth running machine. Before leaving the engine, it should be stated that starting is by means of a crank, as in the case of a car engine.

Mounted on the top of the crank case, as clearly shown in the illustrations, is a compact three-speed gear box with sliding gears. Connection is made from the engine shaft to the gear box by means of a chain, contained in a dust-proof and oiltight aluminium housing, and the final drive is taken by chain. A gate type change speed mechanism, with



The Bleriot vertical twin—a very compact design, in which mudguarding appears to have received serious consideration.

THE LOUIS CLEMENT ENGINE



An overhead camshaft and a shaft-driven magneto are embodied in this design. Both are driven through bevel gear.

its lever conveniently placed to the driver's right hand, is made use of. One of the features of this is a simple locking arrangement by means of a flat blade spring which automatically locks the lever in position on the sector as each gear is successively engaged.

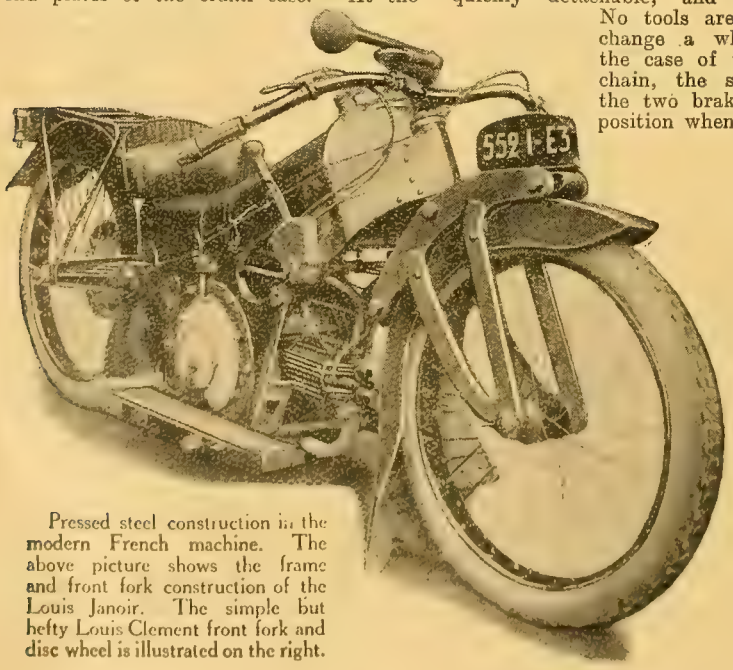
Mention has already been made of the fact that no steel tubes are employed, if exception be made of the handle-bar and the two small tubes for the luggage carrier. The front fork consists of two pressed steel members, the top bar of which is curved. They are united by three pins, the centre one receiving the head piece, and the two end ones being the shackle bolts of opposed leaf springs. This general arrangement is clearly shown in one of the illustrations.

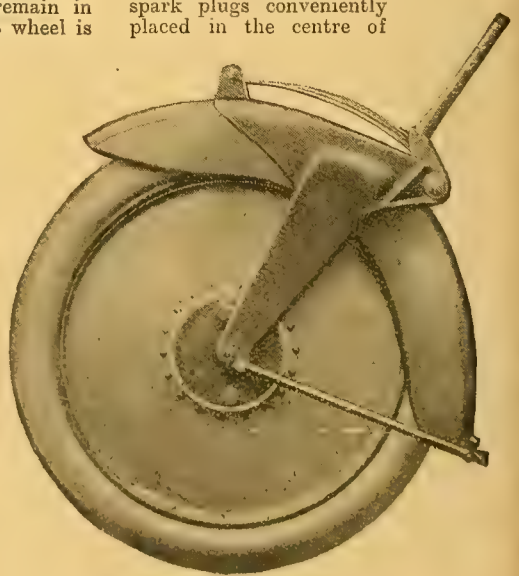
A triangular pressed steel open frame is used, and the engine is bolted into it by a series of bolts going through the end plates of the crank case. At the rear a pressed steel fork, only slightly inclined from the horizontal, is used, with suspension by means of quarter-elliptic springs.

As can be judged from the illustrations, a very low centre of gravity is obtained. The petrol tank is carried within the open pressed steel frame, and at first sight appears to extend from the head to the spring cushion seat. This is not so, however, for the tank stops some distance from the seat, and the intervening space is filled up with a detachable metal cover, by removing which access is obtained to the carburetter and the magneto immediately below and on the top of the engine housing. While being thoroughly protected, these two organs are most conveniently placed for attention and adjustment.

Wire wheels are employed on the Janoir, but they are interchangeable, quickly detachable, and self-centring. No tools are required to change a wheel, and in the case of the rear, the chain, the sprocket, and the two brakes remain in position when the wheel is taken out. Wheel size is 750×85 mm.

In the Bleriot twin an entirely different design has been adopted. Engine and gear box form a unit attached in a more or less standard type of frame. The two vertical cylinders are mounted side by side on an aluminium base chamber, with the exhaust valves facing forward, and the intake valves, the carburetter and the magneto at the rear. The crankshaft has a single throw, the two pistons thus moving up and down together. It is admitted that the balance does not approach that of the flat twin, although this defect has been overcome to a certain extent by light reciprocating parts. On the other hand the cooling is excellent and uniform. Piston displacement is 500 c.c., the cylinder bore being 60 mm., and the piston stroke 88 mm. Excellent features of this engine are the neat arrangement of the exhaust pipes, with perfect cooling; the short intake pipe with the very accessible carburetter; the well protected magneto; the spark plugs conveniently placed in the centre of





Pressed steel construction in the modern French machine. The above picture shows the frame and front fork construction of the Louis Janoir. The simple but hefty Louis Clement front fork and disc wheel is illustrated on the right.

Motor Cycle Design in France.—

the combustion chamber; and the enclosed valve stems.

The multiple disc clutch and the two-speed gear set are contained in the rear portion of the crank case housing. From the main shaft the drive is transmitted through the timing gears to a lay shaft on the extremity of which is mounted the driving pulley. This shaft runs at half engine speed. The lower gear is obtained by means of a dog clutch, and operation is simple and easy.

The Blériot machine is supplied with detachable disc wheels. The mudguards are particularly big, and tend to give a massive appearance to the machine. It has been found, after long road tests, that this width of guard is not really required as a protection against mud, and in consequence the size has been reduced since the machine was first exhibited.

It is stated that the same type of engine, but of 1,000 c.c., will be used in the Blériot Whippet cycle car to be built in France. The Blériot company being one of the biggest aeroplane concerns in France, it is quite natural to find that the sidecars are built up in the same manner as aeroplane fuselages. The lines are particularly pleasing, while the design and the high-class workmanship give lightness with great rigidity.

Engine Units.

These three machines, the Clement, Janoir, and Blériot, are typical of the new French school. They do not, however, exhaust the activities of French motor cycle manufacturers. The product of the Gnome and Rhone Company need hardly be mentioned, for this is built entirely to the British A.B.C. designs. An entirely French design is the Ballot two-stroke, built by the largest engine producing firm in France, with a reputation not confined to that country. It is not the intention of Ballot to produce a complete motor cycle, but to supply the engine only. This is now in production and will be used exclusively by the Alcyon Company. Other firms have arranged to take it up, and the entire output for the next four years is said to be booked. The engine is a unit with its gear set and all control levers. Among its features are the complete enclosing of all working parts. Even the magneto is placed in a dust-proof aluminium casing. Among the French engine specialists, mention should also be made of Anzani, who produced motor cycle engines long before he became interested in aeroplane engines, and who is again devoting his chief attention to power plants for two-wheelers and for cycle cars.

An Adaptation from Aero Practice.

A Proposed Modification of the Monosoupape (or "One Valve") Principle.

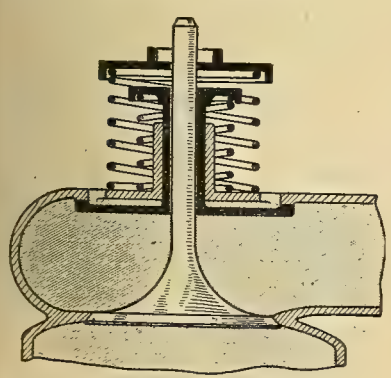
PROBABLY most of the large number of motor cyclists who have been connected with the R.A.F. during the last few years have been struck by the apparent simplicity of the Monosoupape Gnôme engine, and have wondered if the system could be applied to a motor cycle power unit. There are, however, certain difficulties to be overcome before this type of engine can be made roadworthy, and in circumventing them the advantages are mitigated.

One of the simplest modifications which has yet been brought to our notice is the idea of Mr. A. W. Doyle, of Dundrum, Co. Dublin. It is true that the engine can no longer be called a Monosoupape, since a second valve has been introduced, but the action of the valve is subsidiary to the main valve, and in other respects the cycle is similar to that of the well-known French rotary.

For the benefit of those who are unacquainted with the principles involved, it may be as well to explain that the Monosoupape Gnôme has a single valve in the cylinder head, which serves both as exhaust and inlet valve, and a series of holes in connection with the crank case through which a very rich mixture is drawn. The cycle is as follows:

Air is drawn in through the valve (as the piston descends) while the crank travels through 115° from top dead centre. The valve then closes, and a partial vacuum is formed during the next 45° of crank travel. At this point (*i.e.*, 20° from bottom dead centre) the piston uncovers a series of ports through which rich mixture is drawn from the crank case. The mixture is compressed and fired in the usual way, but the valve opens for exhaust at a very early period—85° from top dead centre—and remains open till the end of the inlet stroke.

Now the "Mono" has no silencer, but exhausts directly into the atmosphere, and, consequently, it is unsuitable for road use. If a silencer is fitted it would be obvious that only exhaust gases would be sucked back on the induction stroke. Therefore, Mr. Doyle has introduced a flat valve working concentrically with the main valve, through which fresh air may be admitted.



The concentric valve arrangement on the Doyle engine.

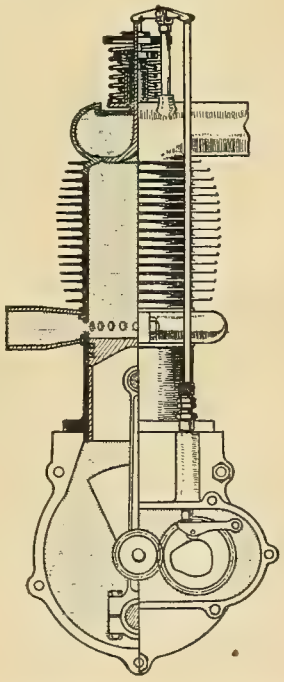
A Double Lift Cam.

From the illustration it will be seen that a double lift cam is used, the first, or lower, step providing the exhaust lift, while the second step raises the valve still further and lifts the auxiliary valve.

In the case of the proposed motor cycle engine, the ports round the base of the cylinder would be in connection with a special carburetter instead of with the crank case.

The working of the suggested engine, which is shown diagrammatically, is as follows: Pure air is drawn into the cylinder by way of the two valves during 140° of crankshaft revolution; then both valves are closed. For a further 20° of rotation a partial vacuum is formed by the continued descent of the piston, which then uncovers a series of holes drilled in the cylinder and communicating with the carburetter, thus allowing a charge of very rich mixture to be drawn in. This excessively rich mixture mingles with the pure air admitted at the commencement of the stroke, and forms a correctly proportioned charge. At 20° past bottom dead centre the rising piston covers up the gas ports and compresses the charge.

The spark, which is timed to take place at from 12° to 14° before the top of the stroke, then fires the charge, and the exhaust valve, operated by the primary cam, opens 40° before bottom dead centre, and remains open until 140° past top dead centre, thus allowing the burned gases to escape. The subsidiary, or air, valve, however, is opened only just after the induction stroke commences by the secondary cam, the exhaust valve being then already open, and as the exhaust gases by their own velocity will have been dispersed, pure air is drawn into the cylinder through the uppermost valve and the cycle is repeated.



An engine based on the *monosoupape* (one valve) principle, suggested by A. W. Doyle.

OVERSEAS SECTION

A Commentary based upon Practical Experience and a Study of Overseas Opinions.

The Uses of a Lightweight.

TIME and again long-distance trials have proved that the modern lightweight is capable of enduring long-distance tours at the legal limit of speed. It should not, however, be imagined that a little two or four-stroke engine is intended to do the work of its larger brethren. It must be obvious to the veriest novice that a big engine running normally on small throttle openings, and consequently developing but a fraction of its maximum power output, will last longer and give better service than a teacup engine which is driven hard in order to obtain similar speeds.

A little common sense on the part of a lightweight owner is all that is required to ensure perfect satisfaction, but this so-called *common* sense is too often lacking. It is a daily experience in this country to see little engines being grossly over-driven, and it is wonderful, under such circumstances, that the tiny machines provide the service that they do. Nevertheless, the many possibilities of the lightweight do not seem to be fully realised in all parts of the world. Wherever there are passable roads or tracks, a modern lightweight can go, and a pony that does not get tired on a fifty-mile trip in hot weather is an advantage not to be scoffed at. In its early stages, the lightweight was a machine fit for little more than an occasional run into town for shopping purposes, but nowadays it is a perfectly reliable and economical mount for all kinds of messenger service. There are already hundreds of owners who live some miles from their places of business, and who daily use a convenient little motor cycle to take them to work without any more thought of mechanical breakdown than if they were relying on a train. For this type of service a good lightweight is ideal, and its popularity is steadily increasing. Small two-strokes score on the point of simplicity and lack of attention necessary; the fuel consumption of the better machines is but little higher than that of equivalent four-strokes. The latter type, however, will always have staunch adherents, on account of its proved reliability and orthodox appearance.

OVERSEAS CONDITIONS.

One of the twenty odd watersplashes on the last day of the Scottish Trials. This was a very mild sample compared with some

❖ ❖ ❖

For Messenger Work.

IN many parts of the world, where a man may live forty or fifty miles from town, and be accustomed to accomplish the journey by means of a horse, the lightweight will prove invaluable, though there are, of course, many places where the tracks are unsuitable for wheeled traffic.

At the present time there is talk of an eventual slump in motor cycles; but if manufacturers in this country are wise, they will turn their attention to the Overseas market, and organise a progressive sales campaign, backed by a good service of spares and replacements. Under these circumstances, they will have no difficulty in disposing of their output for many years to come, while they will have the additional advantage of building up a sound Overseas trade, which leads to a world-wide reputation.

❖ ❖ ❖

Australia Building Motor Cycles.

ELSEWHERE in this issue will be found particulars of two Australian built machines which have more than usual interest to both buyers overseas and the manufacturer in this country. In both cases, the outlines somewhat follow American lines, although the specifications are in no way similar to the productions of the U.S.A. One machine is assembled from British-made components, while the other is all Australian, and strikes a new note in motor cycle design. At the price mentioned it appears to be a very attractive proposition.

A Selection of Letters from Readers scattered all over the World.

A Race for Life.

A race with a cheetah is described by MR. W. A. SMITH, who writes from Uasin Gishu, British East Africa.

"For some weeks past," he says, "I have been in the habit of visiting daily a neighbouring farm and returning in the evening on my Indian motor cycle. A few nights ago I was returning home as usual at sunset when I became aware of what I took to be a leopard bounding along at my side. At first I thought mere curiosity had tempted him to such close quarters, but I quickly realised that it had more serious business in view, so I immediately put on speed with the idea of outdistancing it. Without any apparent effort on its part it outflanked me, and attempted to head me off into the grass. I then made straight for it; this seemed to be unnerving, for it drew back at the last moment, and I went by like a flash. I thought I had seen the last of it, but was surprised on looking back to see it bounding along at my heels. Then followed a veritable race for life. I put on as much speed as the state of the road would allow (about 40 m.p.h.), but it was only after I had done about 500 yards that I commenced to increase my lead. The race continued for another two miles, and when last I looked it was still bounding along 200 yards behind.

"The next evening a party of us went along to the same spot in a car, and there we discovered it lying in wait on the top of an anthill at the side of the road. I immediately put a bullet through its head. It turned out to be a female cheetah, measuring 74in. from nose to tip of tail. The cheetah is by no means rare in these parts, but it is not often seen, and I have never heard of another instance where one has made an unprovoked attack on a human being. This specimen appeared to be in a starved condition, so evidently hunger had driven her to such desperate efforts."

[Mr. Smith encloses a photograph of himself, his machine, and the cheetah, but it is unsuitable for reproduction.—ED.]

Sunny Spain.

Thinking readers of *The Motor Cycle* would be interested in details of motor cycling in Spain, MR. J. F. ADAM, of Valencia, sends the following:

"I thought you might like to know something about motoring in Spain. During the whole time I have been here, I have only seen one 1920 model—a 5 6 h.p. Rover. I know that the moulders' strike held up things a lot, but it seems such a pity that there are not more British machines here, as the market is simply flooded with American stuff. The Spanish people show every interest in the motoring movement. On Sundays here, everybody goes to a place for a 'sunning' at twelve o'clock (they are open here all day), and motor cycles—in fact, every conceivable kind of vehicle—are seen here at this hour.

"In Valencia there is no speed limit, and cars and motor cycles do not have to be silenced I cannot imagine what London would be like if the 'buses, etc., were not silenced, as the noise here is quite bad enough. Petrol is comparatively cheap here to what it is in England. I do not know whether a flat twin Indian lightweight is new, but there is one here. It makes a noise like a Scott, and appears to be very low geared. There are plenty of the latest American machines here—Indians, Harleys', Reading-Standards, Excelsiors, and Emblems.

"The roads in Valencia seem to be pretty bad—pot-holes everywhere; how the machines stand up to them I do not know, as they are far worse than some in England. The authorities are not very particular whether machines are registered or whether lamps are lit at the proper time. I always look forward to your valuable paper, which I have sent out every week, and I read it from cover to cover always. I am glad to see that pressed steel frames are beginning to creep in, and the design of the Pullin seems to be very good. Petrol seems to be the fairest way to tax motor cycles, for the obvious reason that the heaviest machine uses the most fuel, and does the most damage to the roads."

The two-stroke is now coming into its own in the Overseas markets. The makers of the Ivy lightweight recently demonstrated that a properly designed two stroke does not overheat by giving an officially observed test on a famous competitions hill with a gradient of 1 in 3 (the Old Wyche, Malvern), when twenty-five consecutive climbs were made without any engine stop. The engine was running for over two hours, and the average speed was over 18 m.p.h.

Spring Carriers.

MR. C. HARCOURT, of Melbourne, outlines the ideal machine for Australian conditions:

"As a reader of your paper for many years, may I be permitted to make some criticism on the up-to-date British motor cycle. You have for many years advocated spring frames, and Britain is at last making a move in that direction. But why is it that only one firm has put on the market a frame in which the carrier is also sprung? Is it so difficult to depart from the tentacles of convention? In the A.B.C., Precision, Raleigh, and others, though the rider is well insulated from road shocks with an elaborate system, his luggage is worse off than before, for it gets it all.

"Another mystery which I have never been able to solve is, why do we stick to chain and belt systems of drive when shaft drive has so many advantages? It is more astonishing still when a firm like the A.B.C. actually adopts a shaft running longitudinally and then uses bevel gearing so that a chain may be used for the final drive. Chain is a barbarous device at the best, and where it cannot be completely enclosed and run in oil it ought to be tabooed.

"In Australia the roads are not good, and this is one of the reasons why American machines are so popular. They are comfortable and powerful under adverse conditions. They are, however, too heavy for solo work, and there is an opening for a medium twin of, say, 4 or 5 h.p., with caster front and complete rear springing, so that the tool bags and luggage float with the body weight and that of the whole frame."

NEW MODELS AND NEW NAMES.

The Number of Motor Cycles offered to the Public continues to Grow.

THE motor cycle industry continues to grow. Every week sees new firms entering the manufacturing field, and while the output of a number of these will not be very large, in the aggregate they must make an impression upon demand.

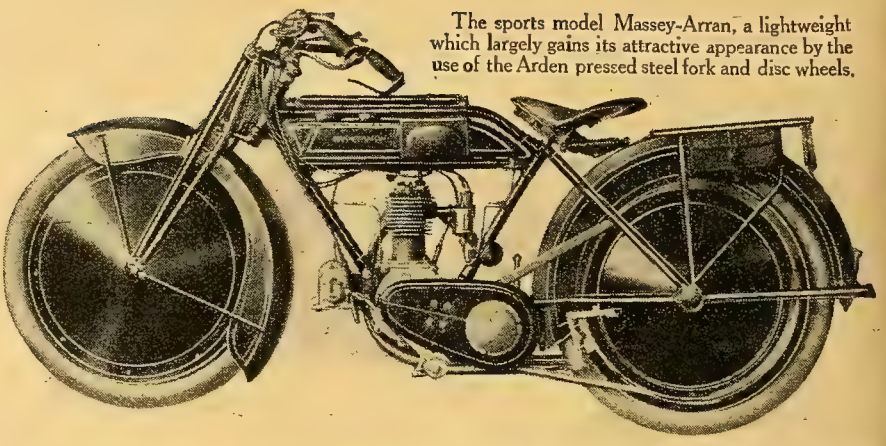
Many of these new makes of motor cycles are what may be termed assembled machines, but even in this field there is a great deal of difference in the quality of the best and the worst examples which may embody the same main units.

In addition to those machines illustrated, there are many which are assembled by garages for local trade, and are therefore not of interest to the majority of our readers. Also, we know of several new models of dual-purpose mounts which are intended chiefly to meet the requirements of those who consider the *de luxe* type of machine too high in price.

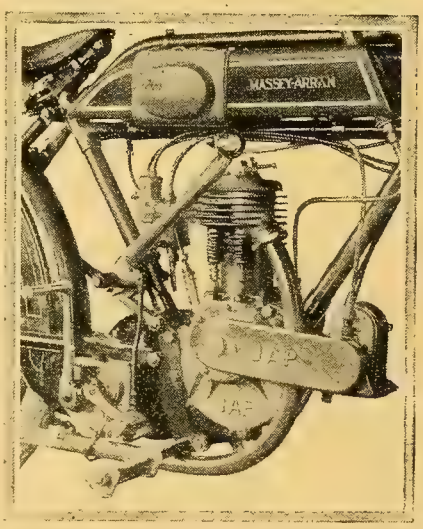
The Massey-Arran Lightweight.

One of the most interesting of the newcomers into the motor cycle field, and one which will appeal especially to the rider who requires a well-made lightweight, is the Massey-Arran. Two models are at present being produced—a sporting model and one for touring, both of which are extremely well finished and attractive in appearance.

The engine is the 2¾ h.p. single-cylinder J.A.P., fitted with C.A.V. magneto and Amac carburetter. No exhaust box is fitted to the sports model, a long pipe with an easy sweep carrying the gases directly to the rear. In the case of the touring machine, however, a large cast aluminium box is used. It is made in three parts,

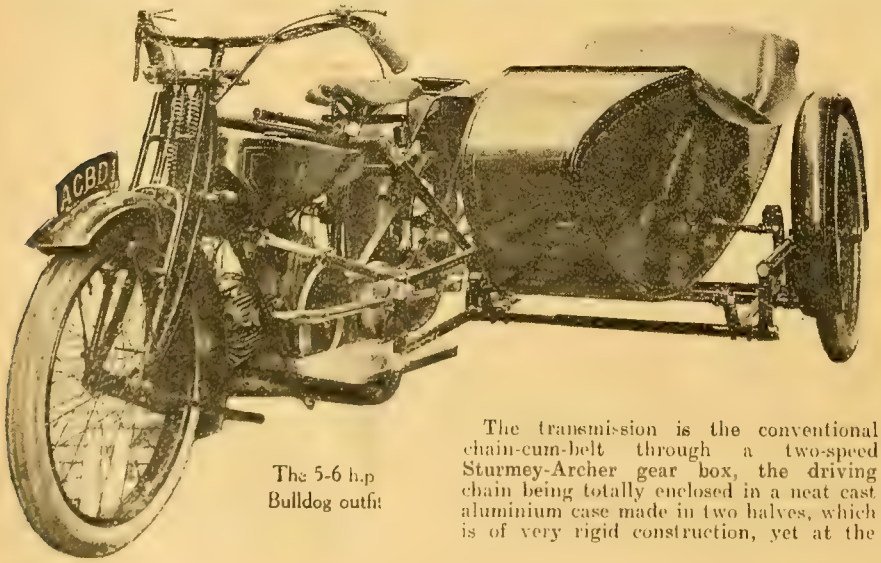


The sports model Massey-Arran, a lightweight which largely gains its attractive appearance by the use of the Arden pressed steel fork and disc wheels.



Valve side of the sports model, showing the clean sweep of the long exhaust pipe, neat aluminium footrests, and the heel-controlled clutch pedal.

as shown in the illustration, and fitted with a long nickel-plated tail pipe, which enhances the appearance of the machine.

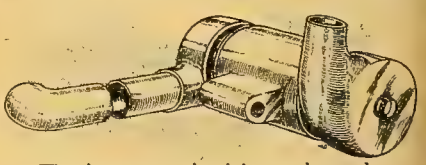


The 5-6 h.p. Bulldog outfit

The transmission is the conventional chain-cum-belt through a two-speed Sturmey-Archer gear box, the driving chain being totally enclosed in a neat cast aluminium case made in two halves, which is of very rigid construction, yet at the same time permits of easy removal for purposes of inspection.

As will be seen in the smaller photograph, in addition to the usual hand lever, a heel pedal is fitted to the end of the clutch operating shaft, giving an alternative means of clutch control.

Long adjustable aluminium footboards covered with rubber matting are fitted to the touring machine, the sports model having aluminum footrests. Wide and



The large cast aluminium exhaust box fitted to the touring models is made in three parts without baffle plates. Asbestos ring washers are used in the joints, the whole being held together by a central bolt.

deeply valanced mudguards are fitted, and the whole machine is finished in smart black with gold lines. Disc wheels, knee grips, and Arden pressed steel forks are standard in the sports model, while the tourist type is fitted with Brampton Biflex forks.

Other details include 26in. × 2½in. tyres, two pannier toolbags, and large saddle. Both machines are marketed at £90, and are manufactured by the Massey-Arran Motor Co., 345, Bellbarn Road, Birmingham.

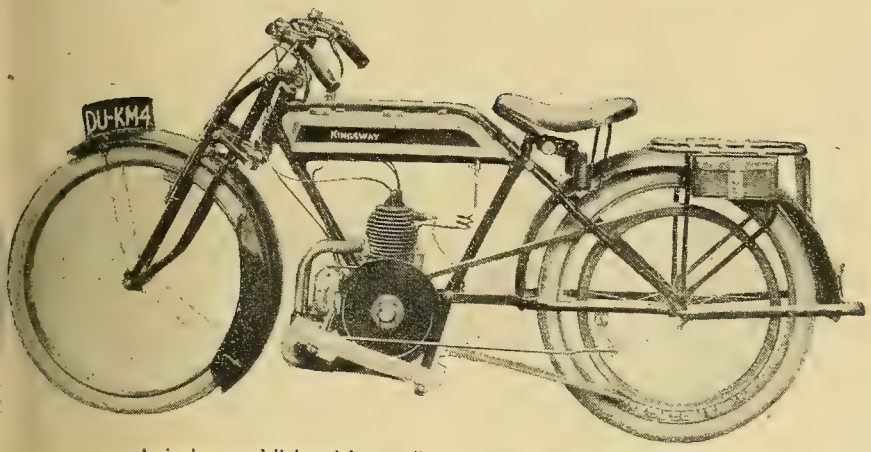
A Big Flat Twin.

Another new machine is the Bulldog, manufactured by H. H. Timbrell, of 59, Slaney Street, Birmingham. The frame is of conventional design with the exception of a special cradle for carrying the engine, which allows of a six-inch ground clearance, and is supported in front by duplex tubes from the head.

The engine is the 5-7 h.p. Coventry Victor flat twin, and is fitted with a T.-B. magneto, and B. and B. two-lever carburetter. No exhaust box is used, the gases being carried directly to the rear through long pipes.

Power is transmitted by enclosed chain to a standard Sturmey-Archer three-speed gear box, thence to the rear wheel by a Pedley belt.

The usual exhaust lifter is dispensed with, as we understand this is considered unnecessary



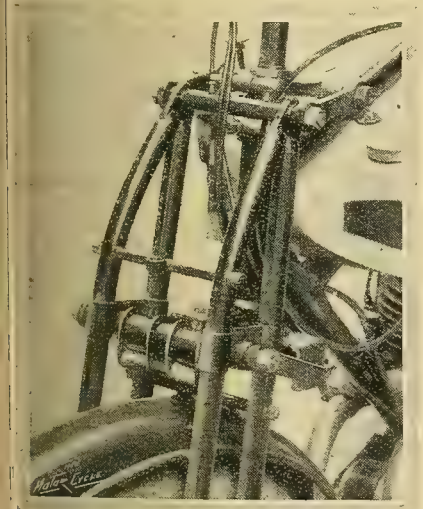
A single-geared lightweight to sell at a popular price—the Kingsway.

Particular attention has been paid to the comfort of the rider, the mudguarding being well carried out; the front guard is deeply valanced, while that at the back is exceptionally wide. Long wide footboards give ample protection for the feet and allow a change of riding position

The tank is finished in black with red panels and gold lines; it is of large capacity capable of carrying two and a half gallons of petrol and half a gallon of oil. Other features of the specification include Brampton Biflex forks, Best and Lloyd lubrication and Gough saddle. The price of the outfit is £180, and we are informed that G. F. Froome, Central Garage, Warwick Road, Olton, who is the sole selling agent, can give immediate delivery.

A Lightweight at a Popular Price.

Known as the Kingsway, the lightweight illustrated on this page is an



The Y spring fork fitted on the Kingsway lightweight.

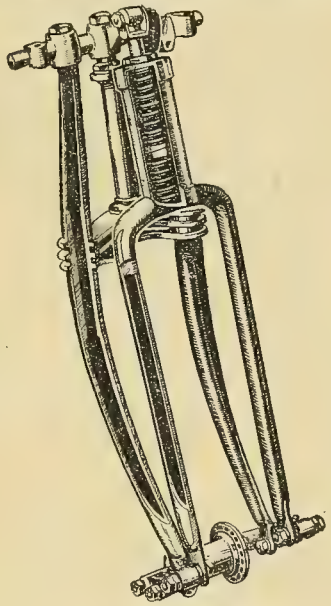
attempt on the part of a new Coventry concern (The Kingsway Motor Cycle Co., Stoke, Coventry) to produce a motor cycle at a popular price. The specification includes a 2¾ h.p. Arden two-stroke engine, Y spring forks, C.A.V. magneto, B. and B. carburetter, Bowden front brake, Lycett's pan saddle and toolbags, Best and Lloyd drip feed, Avon tyres, and aluminium footboards. The suggested price for the single-gear model is £55, the two-speed gear being fitted at an extra £7.

The New American X.

In future the American Excelsior motor cycle will be known as the American X. Many modifications of a distinctly beneficial character have been embodied in the latest model, and the general appearance of the machine is enhanced by the new colour scheme of blue and gold. The familiar transfer on the tank is substituted by the simple letter X, and a new front fork and other detail improvements have been introduced.

The frame construction in general is remarkably sturdy, and the same may be said of the spring fork, which is similar in design to that of the four-cylinder Henderson, but of heavier proportions and having stronger springs. It consists of an auxiliary straight fork bolted at the lower ends to rocker arms, the axis of which is the bottom of the main fork. The hub spindle is connected to the other ends of the rockers. A totally enclosed coil spring is located between the plunger and the upper end of the placed between the plunger and the spring housing, whilst a recoil spring is bottom of the housing. The main forks are reinforced at the head, and the walls of the tapered lower ends are of bigger dimensions, which equalises the loss of strength due to the reduced area of the section.

The three new models are identical, with the exception of the lighting and ignition equipment. Model 20 R will be equipped with an armoured type Splitdorf magneto, whilst the model 20 S is provided with a Splitdorf magneto, in addition to a dynamo of the same make complete with battery, ammeter, lamps,



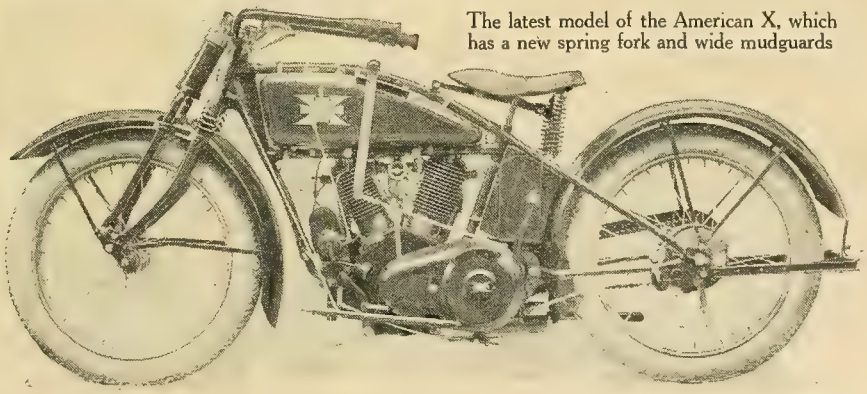
The new American X fork shown in part section.

Another modification is the return to British practice of utilising a cable, in place of rods, for the operation from the off side handle-bar grip of the Schebler and a Klaxon horn. Model 20 M utilises the Midco mag-dynamo, and has an electric horn.

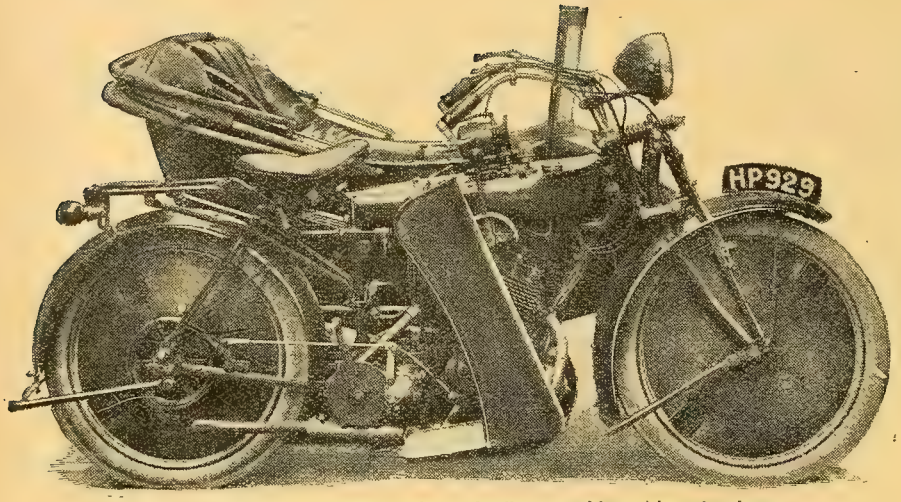
Large Mudguards.

throttle. Wide 7in. domed mudguards have been fitted, and the redesigned frame provides sufficient clearance for the application of non-skid chains. The wheels are now shod with large 27in. × 3½in. Firestone tyres, a size which is becoming increasingly popular in America.

The X motor cycle is handled by Messrs. Melchior, Armstrong, and Dessau, of 14-14a, Great Marlborough Street, London, W.1.



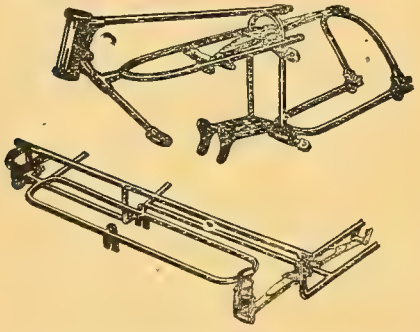
The latest model of the American X, which has a new spring fork and wide mudguards



The Springwell motor cycle, a short wheelbase machine with spring frame.

A Short Wheelbase Spring Frame Design.

We recently examined a motor cycle built by Mr. E. J. Norton, of the Coventry Welding and Engineering Co., 44a, Much Park Street, Coventry, and fitted with his patented system of suspension. A commendable fact is that the wheelbase of the machine is not unduly lengthened—in fact, it is as short as the majority of rigid frame machines. As will be seen from the illustration, the rear portion which carries the wheel is pivoted to the main portion of the frame by a wide bearing at the back of the bottom bracket. The relative movement of this rear portion to the frame itself is controlled by a long laminated spring, the further end of which is anchored at a point nearly midway along the bottom rails. To this sprung portion is also attached the carrier.



The springing system of the Springwell machine, showing also how the sidecar wheel is sprung.

Lateral rigidity is assured by means of the extra wide bearing on which the sprung portion is hinged, and also by the manner in which the laminated spring is anchored. At all points where movement takes place adequate provision for lubrication is made by means of large grease cups fitted to the hollow hinge pins.

A Well-sprung Sidecar Wheel.

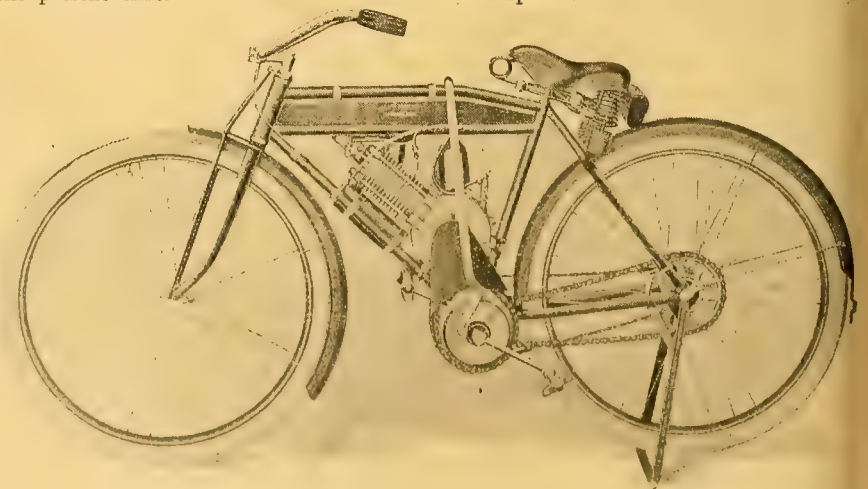
The sidecar chassis has its wheel sprung in a somewhat similar manner to that of the rear portion of the motor cycle. A tubular frame completely encircling the wheel is pivoted at its front end on a bearing of large dimensions, and the other end is attached to a long laminated spring set transversely across the chassis. The illustration is self-explanatory and clearly shows the system adopted.

A short run proved the efficiency of the springing beyond question, no undue shocks being observed when passing over the most atrocious road surfaces. There was also a total absence of that tendency to "swing," which is too often felt when driving spring frame machines, and the feeling of "looseness" was non-existent.

We understand that Mr. Norton would consider offers for the manufacturing rights of both the spring frame and spring sidecar chassis.

An American Lightweight.

A lightweight of the type in vogue in this country about ten years ago is the American made Shaw. It may be described as a step between the motorised bicycle and the lightweight proper. It has a 2½ h.p. four-stroke engine and belt transmission. We understand that there is a brisk overseas business for this machine for short journeys and for general utility purposes where passable roads are encountered. This type of motor cycle is not common in this country at the present time.

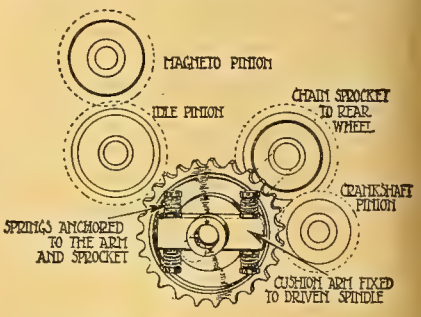


The Shaw lightweight, a type of American machine which appears to be favoured in some Overseas countries

The Harwood Cycle Attachment.

We may say that the neat attachment, weighing under 21 lb., which is marketed by the Harwood Motor Co., Long Lane, Bexley Heath, Kent, gives considerable promise both from our experience when riding the machine, and from the general arrangement of the power unit.

A two-stroke engine having a bore and stroke of 52 × 52 mm. (110 c.c.) is held by two clamps fixed round the two down tubes of the cycle frame. The magneto is mounted on a platform, which in future models will be cast integrally with the crank case, the rear end of which is clamped to the saddle down tube. The usual two-stroke practice has been observed in the construction of the engine, whilst a useful fitting, an inspection plate, is secured by two screws to the transfer port.



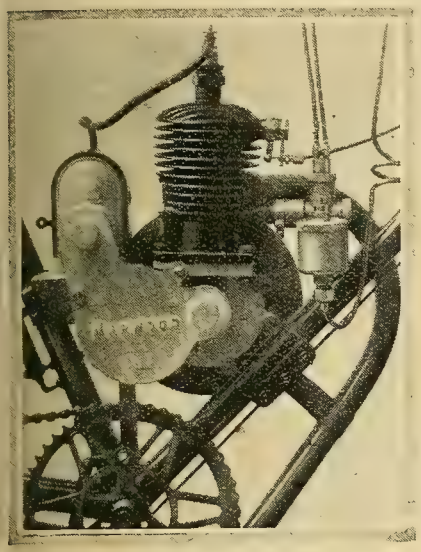
MAGNETO PINION
IDLE PINION
CHAIN SPROCKET TO REAR WHEEL
CRANKSHAFT PINION
SPRINGS ANCHORED TO THE ARM AND SPROCKET
CUSHION ARM FIXED TO DRIVEN SPINDLE

The Harwood transmission, which is enclosed in the crank case casting.

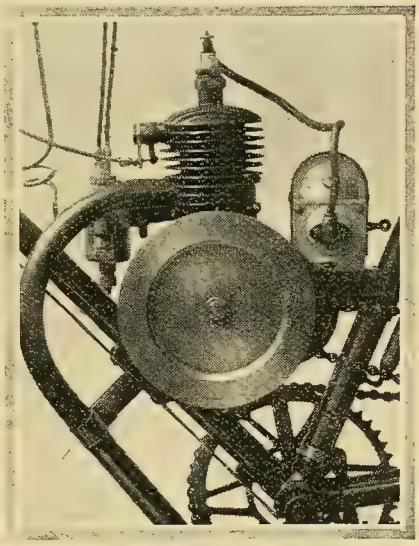
As might be expected from an attachment of this type, the final drive, which is by roller chain to an auxiliary sprocket on the rear wheel, is liable to considerable chain snatch, and in order to obviate this a neat cushion drive is incorporated in the transmission system.

As may be seen from the diagram, a gear reducing pinion is in direct engagement with the crankshaft pinion. The drive, however, is taken through an arm which is in contact with the pinion through four coil springs, which tend to absorb the snatch in the chain. The arm thence conducts the drive, through a spindle running in a phosphor bronze bush, to the chain sprocket.

A NEAT TWO-STROKE MOTOR ATTACHMENT.



Magneto drive side of the Harwood power unit.



Flywheel side of the unit, showing the chain which drives the rear wheel.

The magneto is gear driven through an intermediate pinion in engagement with the driving pinion.

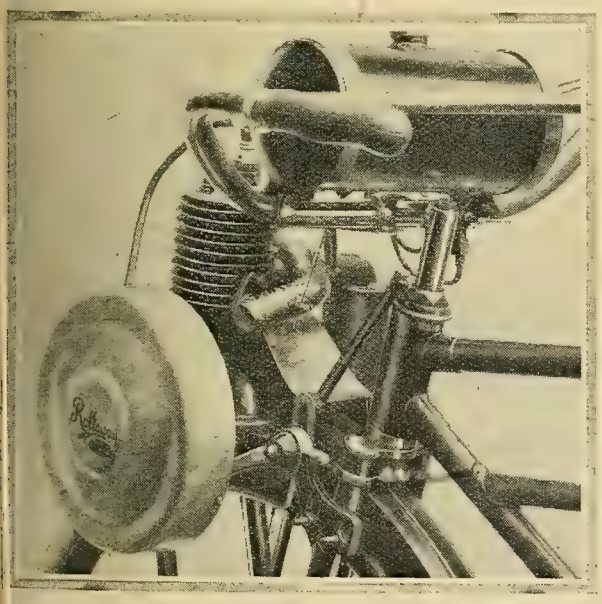
An Amac carburetter is used, and is supplied from a circular tank, which is capable of containing half a gallon of petrol and oil mixed—a quantity sufficient, it is claimed by the manufacturers, to carry the machine for a distance of seventy-five miles.

The makers are prepared to offer the power unit alone or complete fitted to a pedal cycle. The price of the former is £20.

An American Auxiliary Unit.

The "Rollaway" motor cycle attachment for pedal cycles was recently introduced into this country by Mr. Claude Golden, of the Cosmo Commercial Corporation, New York City, U.S.A., whose temporary address in London is 17, Green Street, Leicester Square, London, W.C.

The Rollaway power plant weighs about 20 lb., and consists of a single-cylinder, two-stroke engine, of which the bore and stroke are respectively 50 mm. and 53 mm., developing 1 h.p. at 2,200 r.p.m. It is carried on a suitable bracket bolted to the front forks and to the ends of the front wheel spindle, and drives the front wheel by means of a cast iron pulley shod with rubber. By means of a lever the pressure of this pulley can be decreased or increased at will, so that in the event of any likelihood of slip in wet weather greater pressure can be brought to bear upon the front tyre, whilst it also allows the engine to be disconnected altogether. The petrol tank, which is cylindrical in shape, is carried on the handle-bars, and holds half a gallon of petrol and oil mixed. The magneto is incorporated in the flywheel, following a practice which is not uncommon in the case of American engines.



The American Rollaway auxiliary power unit over the front whee of a pedal cycle.

The method of controlling the mixture is slightly out of the ordinary, as no carburetter proper is used, petrol entering the inlet pipe through a controllable jet worked by a Bowden lever from the handle-bar. In addition to this, there is an ordinary butterfly throttle, by means of which the quantity of mixture may be regulated. The third lever in the group on the handle-bar actuates the compression release. To facilitate starting in very cold weather, there is a shutter at the end of the fixed air inlet.

The machine, when demonstrated to us at Portland Place, appeared to run quite satisfactorily, the roads being exceedingly wet at the time, but the pulley appeared to grip the tyre well.

The Rollaway friction-driven auxiliary attachment being tested under adverse conditions on a rainy day in London

The 4½ h.p. Excelsior.

The new 4½ h.p. Excelsior is perhaps more a sidecar machine than a solo mount—in fact, as the former it has been designed, and has sidecar lugs cast integral with the frame, which also has a specially long head with ¼in. balls. The specification of the machine includes the 4½ h.p. Excelsior engine, which has a bore and stroke of 86 mm. and 112 mm respectively (650 c.c. capacity), Sturmey-Archer gear, chain-cum-belt transmission, 650 × 65 mm. Dunlop tyres, Hans Renold ⅝in. × ⅝in. chain, 1in. Dunlop belt, C.A.V. magneto, Senspray carburetter, and Druid forks. The tank has a capacity for two gallons of petrol and three pints of oil. The price of the machine is £125, or with coach-built sidecar £160, and deliveries are commencing in about two weeks' time.

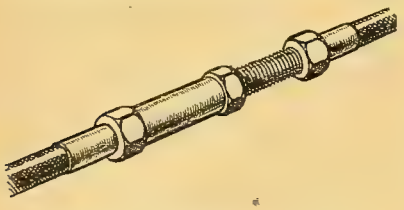
The machine is finished in the thorough manner associated with the firm.

A NEW BINKS CARBURETTER.

A Horizontal Model for Flat Twin Engines, retaining Well-known Features.

THE principles of the Binks three-jet carburetter are already well known to the majority of our readers; but, in addition to the ingenious "damping" pads which prevent leakage of petrol from jets when not actually in use and the extra air on the engine side of the throttle, the latest production embodies new features which are worthy of some description.

Designed primarily for use on flat twin engines, the carburetter fitted snugly alongside the timing cover of the 3½ h.p. Douglas on which it was tested, and since the float chamber is adjustable for position, it was set close on to the engine so as to be well out of the way of the rider's legs. The construction of the float mechanism is simple, but somewhat unusual in that the float is soldered to a spring clip which grips the inverted needle in one of two positions, thus the float and needle become a single unit, and the one



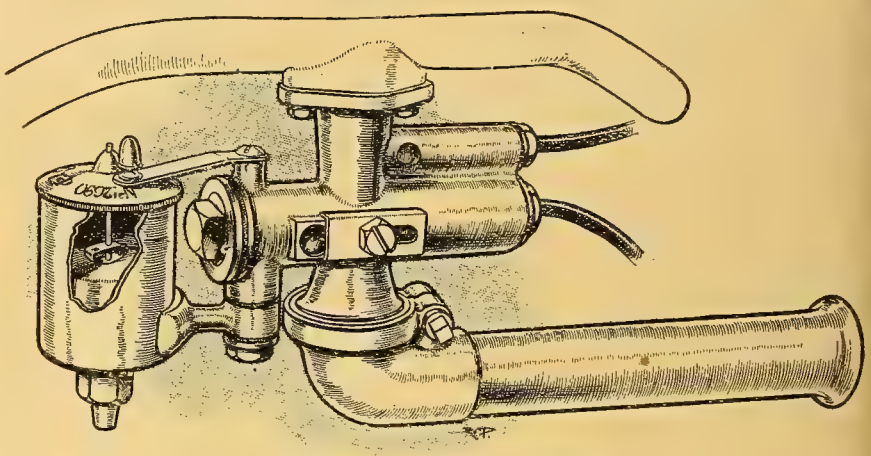
Neat cable adjustment of the Binks control.

does not "jiggle" on the other. In the type under review the jets are disposed horizontally, and are immediately accessible after removing an end cover. This end cover forms an important item, for it is constructed in such a manner as to act as a petrol filter, thus preventing the access of impurities to the jets.

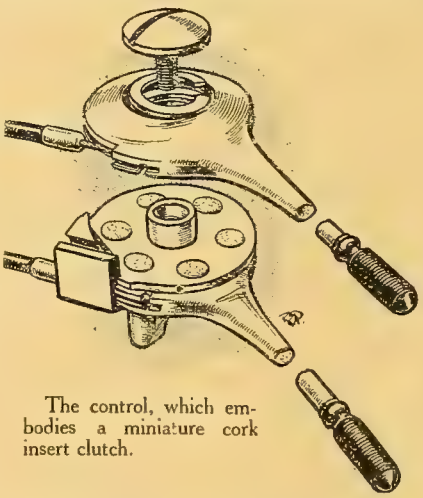
A throttle barrel containing choke tubes for each jet, which are opened progressively by a movement of the lever is, of course, employed, as in other Binks carburetters, and it is hardly necessary to state that the neat little spring-controlled jet dampers form part of this unit.

Improved Slow Running.

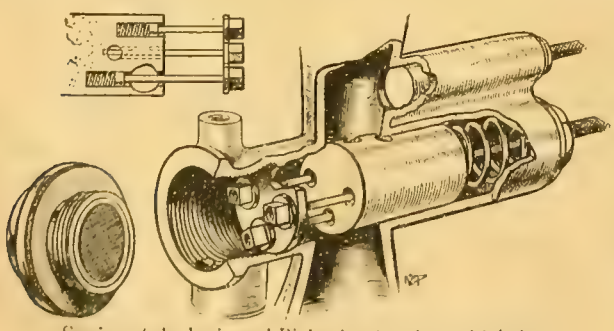
The first noticeable feature on starting up was that the engine ran very much slower than previously. On opening the throttle the engine accelerated well after a momentary choke, and with the aid of the air lever it was the work of a moment to discover that the second pilot jet was too large. To change a jet is a simple matter, and in a few minutes the machine was burbling along with a steady hum. With the series of jets now in use, slow running, acceleration, and speed were all available, but a certain amount of juggling with the air lever was necessary; but as we had been informed that the carburetter could be used entirely as a single instrument, we determined to try another series of jets. In determining the correct jet size the air lever is of the utmost assistance, and the veriest tyro can tell in a moment if a jet is too large or too small. Quite quickly a suitable range of jets was chosen, and so correct was the setting that it was impossible to improve on the road performance by the use of the air lever, though the mixture was slightly weak until the main jet was opened.



The Binks carburetter for flat twins.



The control, which embodies a miniature cork insert clutch.



Section of the horizontal Binks showing the multiple jets.

Such excellent results were obtained with this setting, especially as regards consumption, that we determined to make no further alterations except to fit a hot air pipe which had not been available when the carburetter was first sent to us. The addition of an extemporised fitting made a considerable difference, and for some time we used the carburetter with the utmost satisfaction. The wonderful slow running and excellent consumption obtainable with this instrument were never equalled by any of the four other types of carburetter tested on the same machine.

Mr. Binks makes a speciality of tuning his carburetters to any machine, but the above notes will make it obvious that the selection of correct jets is a simple matter for the normal rider.

Details of the instrument are most carefully carried out and include a simple adjustment for the cables and a cork clutch friction device for the operating levers which provides an extremely smooth action.

BRITISH PROGRESS IN LATE ENEMY COUNTRIES.

AS far as is known Barimar Limited, the welding engineers of 10, Poland Street, London, W.1, is one of the first of British engineering concerns to invade industrially territory formerly known as German East Africa. In association with Messrs. F. Tate, S. Tate and R. Liversidge, of Nairobi, British East Africa, the Barimar Company has arranged a chain of welding factories effectively to cover German East Africa as well as British East Africa, which incidentally will be known, in future, as Kenia Colony, Uganda, Zanzibar, and Nyasaland.

These countries possess great possibilities for development, and it is anticipated that the new engineering workshops will greatly assist and encourage the use of motor vehicles in these countries, because it will no longer be necessary to lay up machines for many months pending the arrival of replacements from England.

Australia Enters the Manufacturing Field.

Two Motor Cycles produced in the Antipodes.

By Our Australian Correspondent.

AUSTRALIA is to produce its own motor cycles. True, only a few firms have started to make machines, but if they are successful others are bound to follow suit, and a field for export trade will gradually be lost to both American and British manufacturers.

One of the Australian produced machines is known as the Aussi-Also, is all-Australian, and the price mentioned in its connection is so low that without doubt it would have a strong appeal with British motor cyclists.

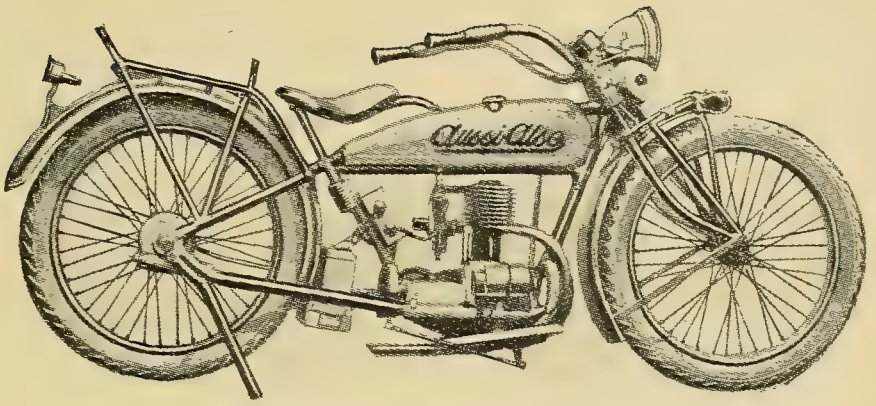
The machine has shaft drive, a large two-stroke engine, and sells at £60.

In laying out the machine the designers have certainly departed from the accepted practice of both Great Britain and America, although externally the products of the latter country have been followed. Mechanically, the machine breaks new ground by having the gear box embodied in the crank case of the two-stroke engine, and by driving with a shaft and worm.

A Large Two-stroke.

The machine was on view in the Exhibition of Australian Industry. It is advertised as designed by Australians, built by Australians, for Australians.

The engine is a large two-stroke, about 6 h.p. by English rating, but it is claimed to develop 7 h.p. This type of engine is adopted for its simplicity, as the average "Aussie" is a slap-dash individual not accustomed to fine machinery. The crank case incorporates the clutch and two-speed gear, the whole of these moving parts therefore running in oil. The engine and gear box unit is placed longitudinally in the frame, and the drive is taken from the layshaft of the two-speed gear to the rear wheel by shaft *via* a universal joint; it is therefore unaffected by wet when fording streams. The final drive is by enclosed worm gear (*via* another universal joint).



The Aussi-Also, an all-Australian machine with shaft drive and large two-stroke engine.

Close Gear Ratios.

The clutch is of the cone type, Raybestos lined, of very generous dimensions, and the two-speed gear is of the constant mesh, dog clutch variety. The top ratio is 4¼ to 1, and the second 6¼ to 1. This is one of the few points open to criticism in the machine. A lower second gear ratio would seem advisable, especially if a sidecar is to be fitted. It must be noted, however, that this model is not designed for sidecar work, a more powerful model with twin cylinders arranged tandem fashion (car practice again) being in process of evolution for this purpose.

The Delco system of combined lighting and ignition is fitted as standard, the dynamo taking the place of a magneto.

The present price of the machine is £60, which, if it can be maintained, should cause English manufacturers with their present high prices to look to their laurels. A large factory for mass production has been erected, but labour troubles at present prevent it working to its full capacity, and delivery cannot be promised within four months of date of order.

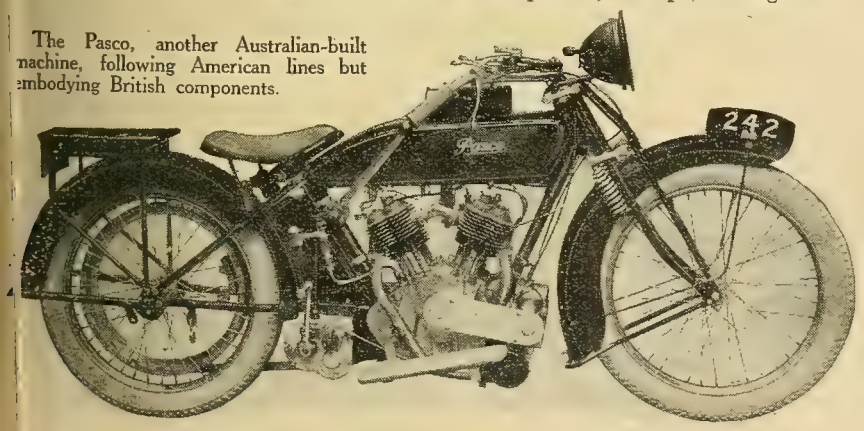
The second machine is a J.A.P.-engined model known as the Pasco, and is manufacured by Messrs. McCrae and Pasco, 242, Elizabeth Street, Melbourne, Victoria.

The frame, it will be observed, has a curved top tube, and possesses graceful lines, while Druid forks are fitted. The mudguards are wide and have deep valances. The lubrication is by a force feed pump combined with a drip feed attached to the lubricating oil tank fitted to the rear, behind the saddle tube, while the transmission is chain-cum-belt through a Sturmey-Archer gear.

Several patents have been incorporated in the Pasco, namely, a patent toolcase underneath the carrier, and a locking device consisting of two lugs brazed to the stand and joined to the stays so that a padlock can be passed through without there being any necessity to use a chain.

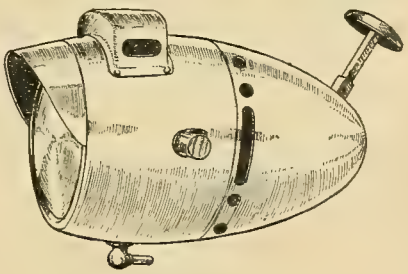
The frame is enamelled in black, and the tank black with gold lines, while the wheels are white with gold lines.

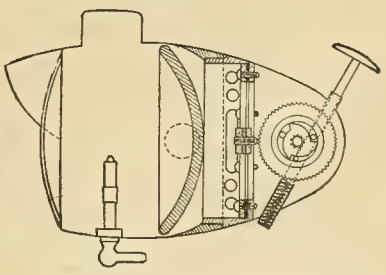
The Pasco, another Australian-built machine, following American lines but embodying British components.



Combined Lamp and Horn.

WE have before us an experimental lamp and horn made by a reader —Mr. A. W. Taylor—to demonstrate the advantages of his patent combination of these two units. The idea appears capable of development. Below we give illustrations of the device for the production of which the designer is willing to negotiate with manufacturers.





A. W. Taylor's patent combined lamp and horn.

A Trial for Motor-assisted Bicycles.

A French Event which attracted Twenty-five Competitors.

Three types of French motor-assisted bicycles in the recent trial in Paris.

On the left the Motor Fly Voisin—the winners—are shown starting in the hill-climb. The centre picture depicts two Cyclotracteurs starting. A third type—the Lumen—is shown on the right.

WITH nearly three and a quarter million bicycles in use in France, there ought to be a good field for the small engines designed to assist these machines over hill and dale. It was as a matter of propaganda and demonstration, therefore, that France held its first motor-assisted bicycle competition on Sunday, the 11th, in the suburbs of Paris, over a set of roads of not very excellent quality. Twenty-five machines faced the starter for the forty-mile trip, which had to be covered in 3 hr. 12 min., or at an average of a little more than 12 miles an hour. Failure to finish within this time entailed penalisation at the rate of one point per two minutes.

Eleven of the twenty-five competitors came home within the time limit, and in order to find a winner, the clean score men were sent away, with a standing start, on a kilometre hill. This gave an opportunity to Raimbault, on the Voisin Motor Fly, to prove the superiority of his mount, for he climbed the hill in 1 min. 43⅘ sec., or nearly six seconds faster than his closest rival, Dieudonné, on a Lumen machine. As all three Voisin machines had finished within the time allowance, they secured the team prize. The Voisin Motor Fly is a friction type of machine produced by the well-known aviation concern, which also builds a high-grade car. The other makes represented in the competition were Lumen, Cyclotracteur, Johnson Motor Wheel, and Monet-Goyon.

The number of motor attachments used in this country is increasing rapidly week by week, and a similar trial of British machines would undoubtedly go far to demonstrate the utility of the motor assisted bicycle.

The B.M.C.R.C. First Open Meeting.

One-design Classes to be introduced. Inter-'Varsity Race.

SEVERAL innovations in the usual British Motor Cycle Racing Club programmes will be made on Saturday, August 14th. Special races will be organised for Zenith and Douglas motor cycles respectively. This is a very excellent idea, which should bring forth some surprising finishes, and is following the lines of yacht racing, when "one design" classes are often instituted. Each yacht competing is similar in every detail, and the winning of the race is due (theoretically) solely to the skill of the helmsman. The suggestion of introducing this idea into motor cycle racing is not novel, and was put forward by a member of our staff some years ago.

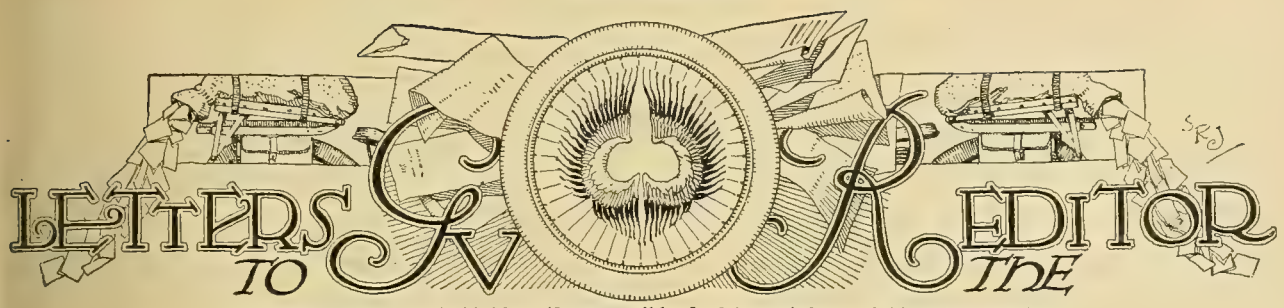
In each race the machines entered are to be standard, the Douglases to be 2¾ h.p. and the Zeniths with 6 or 8 h.p. side-by-side valve engines, and in order to decide what is a standard model, representatives of the manufacturers concerned will be appointed to adjudicate.

One would expect that races of this kind will produce close finishes, but, as we have suggested, some interesting surprise may be forthcoming.

In addition to the above there will be the Senior Open Handicap for motor bicycles with engines exceeding 350 c.c. the Junior Open Handicap for motor bicycles with engines not exceeding 350 c.c., and the Passenger Open Handicap (unlimited).

There will also be car races organised by the Essex Motor Club.

Any who realise what it means for a 3½ h.p. machine to average over 70 m.p.h. for ten laps of Brooklands will appreciate the performance of R. Kaye Don, on a 490 c.c. Norton, who recently won the ten-lap M.C.C. Championship. His time for the distance was 23 min. 15 sec.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

CYLINDER WASHERS.

Sir,—May I call your attention to "Ixion's" remarks on cylinder washers. I had to fit new washers to the base of my cylinders, and as they were made of some composition about 3/32in. thick I could not see how I should manage, but thought of cutting with a fretsaw. It answered extremely well; the saw did not leave any frayed edges, and the fit was exact. I might mention I marked the stud holes with a long needle.

Perhaps "Ixion" might find this useful next time.

A. B. HUNT.

ROADSIDE COURTESY.

Sir,—In reply to "W. 8406's" letter on roadside courtesy: I was riding, a few weeks ago, about five miles from home, when my sidecar tyre burst beyond all hope of repair. I was plodding along by myself when I met the owner of a Zenith outfit without a passenger; he asked me what the trouble was. On being told that I had left my wife and a lady friend footing it a few miles back, he at once offered to go and meet them; which he did and conveyed them right home—for which kind action I could not express enough gratitude.

A. A.

Southampton.

CLUB FOR EX-R.A.F. OFFICERS.

Sir,—I trust I may use some of your space to put forward a suggestion as to the forming of a motor cycle club for ex-R.A.F. officers.

I feel sure such a club would meet with plenty of support. As is well known, a great number of ex-flying officers are keen sporting motor cyclists, and in these days of dull routine, when the good old happy-go-lucky R.F.C. days are but memories, it would liven things up immensely to meet old friends (and new) at runs, trials, and the like.

I hope others will write and express their views.

Wishing your paper every success,

BLIP SWITCH.

Bushey, Herts.

A TYRE REPAIR.

Sir,—Recently I had a bad cut for about two inches in my outer-cover, on almost a new tyre. The tyre was practically ruined, and as I hardly liked throwing it away, having had but little use out of it, I thought of this little plan which has worked very well, and has enabled me to go on using it without trouble. First I cut the beads off the outer cover for about three inches each side of the burst. Then I cut off six inches from a scrap cover, and put it over the top of the burst like a gaiter, and tucked the beads of the short piece of cover into the rim where I had cut the beads off the burst tyre. Blown up hard, the job is a good one. If it is desired to get the short piece in more easily, it may be riveted on to the burst tyre at the four corners near the beads, with the heads of the rivets inside.

H. J. VAISEY.

WELDING MOTOR CYCLE FRAMES.

Sir,—It seldom happens in questions of practical mechanics that one can take a point and settle it purely on its own merits; there are almost always incidental matters that have to be considered, and not infrequently the result is that the main question is decided on a side issue.

I think this may prove to be the case in connection with the jointing of motor cycle frames. In itself it is quite possible that it is better to weld the tubes together than to braze them into lugs. But a lug joint is much more rigid than a welded one, that is to say it offers a far greater resistance to angular disturbance. Unfortunately, in the present undeveloped state of frame design, this rigidity is of vital importance, as, the parts of the frame being made up of multi-sided figures, the whole depends for its strength very largely on the angular rigidity of the joints.

I saw a very practical demonstration of this some time ago, where the owner of a welded diamond frame pointed to one of the angles, and complained that the enamel would not stay on there. The steel was almost bare, and the explanation was that the constant movement of the metal around the joint caused the enamel to flake off.

Of course, this tendency of the joints to work does not exist in any part of the frame that is properly triangulated, and there it should be possible to adopt welding with a minimum of risk.

DOUGLAS LEECHMAN.

PRICES.

Sir,—On page 697 of the issue for June 24th, "Ixion" comments on prices, and states £150 to be not an uncommon figure for a solo mount. Is it a coincidence that on the opposite side of the page the Quadrant advertise their big single combination at £135?

Now, the component parts of this make, gears, tyres, magneto, carburetter, and chain, are all as fitted to many other leading makes. Therefore the finish, frame and engine account for the difference.

When the reconstructed Quadrant Company commenced output in 1914, on the advice of a friend in the trade, I purchased one. I drove this combination up to the day I crossed the Channel, when it was sold.

In 1919 I ordered another, and took delivery of a 1920 model some months ago.

On any good highway I can easily average 30 m.p.h. without pushing the 'bus, and I have got to meet the ordinary main road hill that I cannot roar over on a 5.1 top gear. For hill work I consider the big single hard to beat.

I have no connection with the Quadrant Company, and have paid full list price for both my machines, and if I had to purchase another outfit to-morrow I would not go past this big single at its price.

BIG SINGLE.

Acton.

BOOKS AND MAPS FOR MOTOR CYCLISTS.

Issued in conjunction with *The Motor Cycle.*

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland. London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4, or of leading Booksellers and Railway Bookstalls.

REUNION OF EX-D.R.'S.

Sir,—The idea of a reunion of old despatch riders seems to have caught on. In this letter I would like to answer "Under aged at First."

I quite appreciate this man's feelings in the matter, and I know of dozens of cases in which boys were unable to join owing to being under age; but my idea was to have a reunion of despatch riders who came up on their own and were not sent for. Of course, I know it is very hard lines for the youngsters who were unable to join, nevertheless I make the following suggestion, that a Southern and Northern reunion is held, the Southern to be in London, and the Northern, say, in Manchester. As I stated in the previous letter, the Northern county fellows perhaps would not have time or money to travel to London, and *vice versa*. I am perfectly willing to undertake the reunion for the North if someone else will undertake the South. If any of the old R.E. despatch riders are interested in the North, and would help me, I shall be very pleased, as it is going to be a big job. Perhaps *The Motor Cycle* (a paper which is always ready to help) can assist. I am sure we shall all be very grateful. F. C. SCHOFIELD, late Capt. R.E.

GARAGE REPAIRS.

Sir,—Is it not time that something was done to improve the standard of repair work in garages? I have been in the habit of using garages from time to time to do small repairs and decarbonising, etc., in order to save myself the trouble. In nearly every case I have had to go over the job myself after the garage people had finished with it. I have found nuts not screwed up, washers missing, the edges of nuts that were tightened burred over, and endless small things, which all go to show in what a very careless and shipshod way repairs are carried out. No doubt there are good men in garages—by good men I mean experienced fitters and turners, etc.—but one seldom sees them. No doubt they spend their time on cars, whilst the unhappy motor cycle is relegated to a boy of sixteen, who has served perhaps two months of his apprenticeship, and hardly knows a hacksaw from a screwdriver. In addition to his ignorance, the boy has no interest in the machine he is working on, and as long as the machine holds together when he has done his worst he does not care.

Everyone will admit the boy must learn his job, but why can he not learn under the supervision of an experienced man, rather than at the expense of motor cyclists? It would be interesting to hear some of your other readers' views on this subject. As far as I can see the only way to remedy the matter is to refuse payment for "dud" repairs, or report the matter to the A.C.U. L.P.

Plymouth.

BENZOLE AND TWO-STROKES.

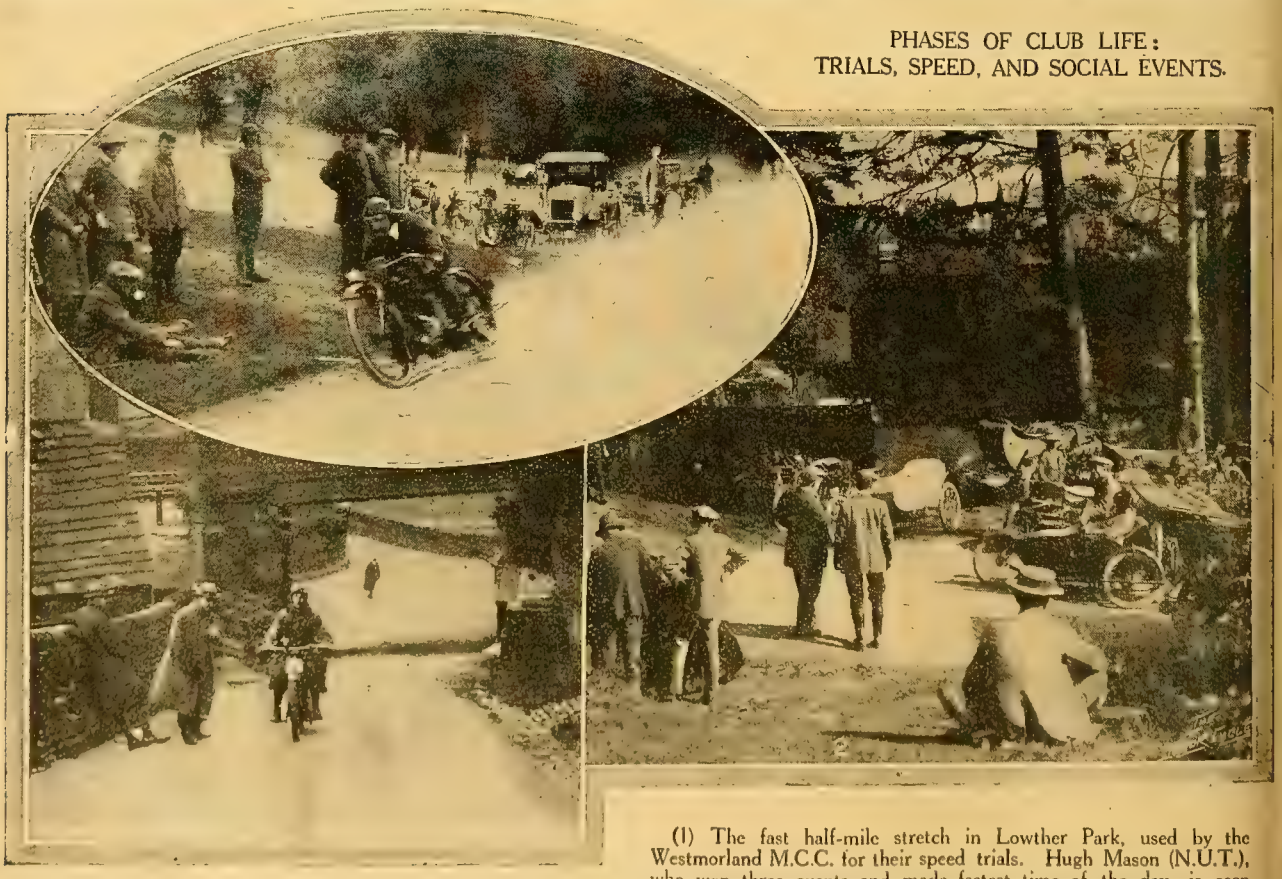
Sir,—In your issue of July 8th Mr. S. J. Bond asks for views of readers regarding benzole in two-stroke engines.

My machine is a 2¼ h.p. two-speed Velocette, and has done over 3,000 miles on Anglo's benzole. Below I give my experience with home-produced fuel:

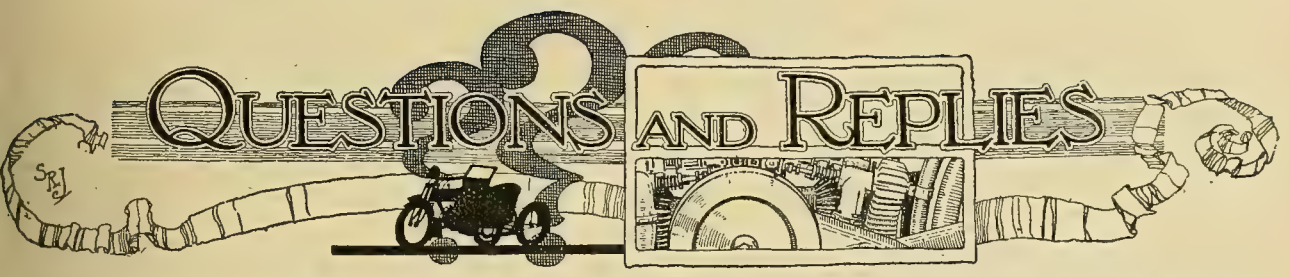
1. Engine extremely smooth running and controllable at all speeds. No "high speed" knock experienced.
2. Increased power generally.
3. Increased m.p.g.
4. Jet reduced from 26 to 24. Air lever permanently fixed in fully open position. Machine driven solely on throttle, with no "popping back" at small openings.
5. On decarbonising after approximately 900 miles, deposit in combustion head surprisingly small, but exhaust port almost choked.
6. Benzole appears to attack solder in tank joints, thereby causing leaks. So far no trouble has been experienced with carburetter float (brass), but on examining a copper float from a car after running on benzole for five months the metal was found to be completely eaten away.

West Bergholt. VA DOUCEMENT.

PHASES OF CLUB LIFE:
TRIALS, SPEED, AND SOCIAL EVENTS.



(1) The fast half-mile stretch in Lowther Park, used by the Westmorland M.C.C. for their speed trials. Hugh Mason (N.U.T.), who won three events and made fastest time of the day, is seen crossing the line "all out." (2) Leith Hill, Surrey, is a favourite rendezvous for motor cyclists, and invariably presents a busy scene during the summer week-ends. (3) A. Roberts (4 Verus-Blackburne) at the commencement of the long climb above Ambergate Church in the recent reliability trial of the Loughborough and District M.C.C.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Will not Run Anyhow.

(1.) My machine (a two stroke) came to a sudden standstill with a click, since when the magneto has been overhauled and re-magnetised, three new rings provided, all air leaks stopped. The magneto was retimed fully retarded, with piston on top dead centre, points just breaking. (2.) Twenty different plugs have been tried—all give good spark *outside* cylinder; but *inside*—neither priming nor heating plug results in the shadow of an explosion! All the usual and likely faults have been tested, and the only engine fault apparent is a worn big end. The carburetter is O.K., and the compression good.—A.E.S.

We presume that you have not replaced your piston the wrong way round, as very often this has been done. When fitting the packing between the cylinder and crank case, it is possible that you so cut that no free passage was given to the transfer port, which would, of course, prevent any mixture from reaching the combustion chamber.

Won't Exceed 53 m.p.h.

Six weeks ago I bought a 1920 6-7 h.p. machine fitted to a sidecar. I sold the latter and took the machine out. I could only get 45 m.p.h. all out. The engine sprocket has sixteen teeth, giving $4\frac{5}{8}$ to 1 gear on top, and the jet is a size 30. My weight is fourteen stone. Since then I have *(a)* retimed magneto, *(b)* fitted 31 jet, *(c)* fitted sprocket with seventeen teeth, giving $4\frac{1}{2}$ to 1 gear, *(d)* removed exhaust extension pipe, *(e)* widened points of plugs, and *(f)* adjusted tappets. On the road I can now just do 53 m.p.h. all out. (1.) Is this a good pace? Surely a 6-7 h.p. twin, even a roadster, ought to do more. (2.) Can you give me any other tips for getting a better top speed?—A.B.W.

(1.) A speed of 53 m.p.h. as a maximum is not too good for your machine, but, after all, you must remember that it was designed primarily for sidecar use, and there are comparatively few sidecar machines which will exceed 55 m.p.h. (2.) You have apparently made all possible adjustments, and it is quite likely that you will not better the speed mentioned, no matter how you try. The engine is not designed for extreme speeds, it is of a low compression type.

Poor Consumption and Bad Starting.

I have a 5-6 h.p. Rover outfit (J.A.P. engine), which, apart from the point now raised, gives me satisfaction. (1.) Petrol consumption is abnormally high, solo, 30-35 m.p.g.—sidecar does not make any appreciable difference. Compression very good. The B. and B. carburetter is not flooding, and I tried a 28 jet instead of 30; is this larger? There certainly seemed to be more power. I give all the air the engine will take, until I hear the popping which indicates weak mixture. (2.) The clutch is in the gear box chain wheel. How should it be lubricated—if at all? I have done 1,000 miles since buying the machine. (3.) In a recent issue, a writer spoke of trouble in starting a warm engine. I often have this and wonder if it indicates serious wear. It seems to me he rather evades the question and only hints at poor compression.—J.J.B.

(1.) The petrol consumption is very high, and you should obtain 45-50 m.p.g. with sidecar. The 28 jet is smaller than the 30, and you might try the effect of a still smaller one, say 26. Possibly the high consumption is due to leakage from part of the petrol supply system, or to the level in the carburetter being too high. Carefully overhaul these parts. (2.) The clutch does not require lubrication. (3.) If an engine will start reasonably well when cold, there is no particular reason why it should not start instantly when warm, unless some of the adjustments are affected by the expansion of parts when heated; for instance, the valve stems may expand when the engine is hot, and so take up the tappet clearance, thus preventing the valves seating and so causing loss of compression. In the case to which you refer, the trouble was probably due to lack of compression resulting from the piston being badly worn in the cylinder. When the engine was cold, the thick oil on the cylinder walls would retain the compression.

Konking.

Having recently bought an old 1910 or 1911 Triumph motor cycle, I should be glad of your advice on the following points: (1.) Is the compression ratio too high, as the engine knocks when accelerating rapidly or ascending hill slowly? The ignition is not too far advanced, points just commencing to open on full retard. (2.) Approximate m.p.g. per quart of oil (T.T. Mobiloil)? (3.) I had a new crank pin fitted, and when I came to reassemble the engine I found that the flywheels when bolted together were not parallel. When tested with inside callipers there was about $\frac{1}{16}$in. difference between opposite sides. I reassembled the engine completely, and it runs perfectly with no vibration whatever. Will this be deleterious to the engine or bearings? (4.) Is it possible to make the carburetter semi-automatic, at the same time preserving economy? I believe I can now get about 90 m.p.g. —M.B.

(1.) The compression ratios of the earlier Triumph engine were rather high, and it is usually necessary to retard the ignition when accelerating from a slow speed or when ascending hills. The ignition timing is rather too far advanced; the points should be just about to open when the control is two-thirds retarded, the piston being on the top dead centre of the compression stroke. (2.) About 200 to 250 miles per quart of oil. (3.) There should not be the amount of difference you mention between the two flywheels; but, provided the main shafts are in correct alignment, and as the engine runs well without vibration, little harm should result. If any trouble is experienced, however, it will probably have an effect on the bearings; but this depends, of course, on the correct alignment of the shafts. (4.) It is not likely that you can make the carburetter automatic without sacrificing economy to some degree.

C3

IMPORTANT DATES.

Sun., July 25th, to Aug. 1st—
International SixDays Trial in France.

Thurs., Aug. 5th, to Mon., Aug. 9th—
Anglo-Dutch Trial in Holland.

Sat., Aug. 7th—
East Midland Centre A.C.U. Open Speed Trials at Chatsworth Park.

Sat., Aug. 7th—
S.A.C.U. Inter club Meet at Callander.

Wed., Aug. 18th—
South Wales Club's Open Speed Championship on Penchine Sands.

Mon., Aug. 23rd, to Sat., Aug. 28th—
A.C.U. Six Days Trial.

Sat., Sept. 4th—
Scottish Speed Championship at St Andrews.

Scott Trial in Yorkshire.

Nov. 29th Dec. 4th—
Olympia Motor Cycle Show.

75 to 95 M.P.G.

I have a 1920 Baby Triumph, and shall be very pleased to have your advice on the following. (1.) I am only getting about 50 m.p.g. What do you consider a reasonable consumption? (2.) The fault seems to be in the carburetter, which is always flooding, the crank case being covered with mixture after a run. Do you consider I should alter the petrol level? If so, how? (3.) Which type and make of plug do you consider best for this machine? (4.) Do you consider this machine capable of taking a 10 st. man a tour of 500 miles, in a hilly district, at the rate of 170 miles per day?—C.S.C.

(1.) 75 to 95 m.p.g. (2.) Apparently your petrol level is too high. It will be necessary for you to lower the position of the collar on the needle so that the petrol supply is cut off earlier. (3.) Any single point plug with a large and substantial central electrode will give satisfaction. (4.) The machine is no doubt capable of the journey, but you will find 170 miles per day extremely tiring.

Two-stroke without Power.

Up to about a month ago my 2½ h.p. two-stroke has run fairly well, but I could not get more than 15 to 20 m.p.h. out of it, also not more than 20 m.p.g. (benzole). I have tried petrol, but with no better result. Can you explain the cause? There seems to be practically no power, but the engine will start quite easily on bottom or top gears. On mounting, it slows down and stops compression. The carburetter and magneto all seem in good order.—A.B.P.

There is evidently something radically wrong with either your engine or carburetter, as you should get from 75 to 95 m.p.g. You might verify the following points: (1.) The petrol level should be $\frac{3}{32}$in. below the top of the spraying jets, with the carburetter in a level position. (2.) See that the float itself is not punctured. (3.) See that the petrol pipe is thoroughly clear. (4.) We trust you have not reversed your piston by any chance. The short lip on the top of the piston should be nearest the sparking plug hole, *i.e.*, towards the back of the engine. (5.) Magneto timing, which will be near enough if the platinum points are opening with the contact breaker cover in the fully retarded position, when the piston is on top dead centre. You state that compression is good, therefore the assumption is that your rings are in decent order. If you notice a large amount of oil exuding from the main bearing of the crank case it will mean that your crank case compression is being lost at these points, and attention to the bearings will be necessary.

Worn Bearing Housing.

(1.) I have taken down engine shaft and gears of my 2¾ h.p. F.N., and find considerable play between the crankshaft bushes and crank case, although the shaft fits bushes perfectly. I found remains of thin copper packing between bushes and crank case: is this the usual method of making bushes a tight fit? Would the usual brown paper packing, as used for crank case, hold the bushes? (2.) Both cams being on one wheel, what would be the best method of timing F.N. ?—F.J.W.

(1.) It is usual when a bearing is slack in the crank case to pack it with copper foil or some similar substance. Brown paper is sometimes used, but is not very satisfactory. If you find that copper foil does not fulfil your requirements, we would recommend you to have a new bearing turned up. (2.) Arrange the valve timing so that the exhaust valve closes on top dead centre, or a fraction later—this will give you the correct valve timing throughout.

Qualifications of Patent Agent.

(1.) What qualifications are necessary to become a patent agent? (2.) Is it necessary to pass any examinations for this purpose? If so, what examinations? (3.) What does the term "registered" patent agent signify? What registration fees are payable, and who is the registering authority?—S.L.H.

(1.) You require a knowledge of mechanics, various manufacturers, foreign and British patents, designs, and trade mark laws. (2.) It is necessary to pass *(a)* a preliminary examination, such as the London Matriculation; *(b)* an intermediate examination; and *(c)* a final examination. The examinations *(b)* and *(c)* are held by the Chartered Institute of Patent Agents under the auspices of the Board of Trade. (3.) No one may practise as a patent agent until he is registered, *i.e.*, has passed the above examinations and is qualified. A further step is to become "chartered." The registration fee is three guineas per annum, and is payable to the registrar of the Chartered Institute of Patent Agents. Fuller particulars can be obtained from him at Staple Inn Buildings, London, W.C.2.

Fitting Aluminium Fins.

I have a 3 h.p. Twin Enfield and am desirous of fitting aluminium radiating fins to the cylinders; one reason being that I want to keep the engine cool, and another is to improve the appearance of the cylinders which have several fins knocked off at the top. Will you please tell me the best method of fastening these fins, which I intend to cut out of thin sheet aluminium?—F.W.C.

It is possible to fit aluminium fins by wedging sheet aluminium discs between the existing fins with aluminium wedge pieces; but you will find that this is a very delicate and rather difficult job.

RECOMMENDED ROUTES.

DONCASTER TO ST. ANNE'S.—G.A.M.

Doncaster, Barnsley, Huddersfield, Halifax, Todmorden, Burnley, Accrington, Blackburn, Preston, Lytham, St. Anne's.

SWINDON TO LIVERPOOL.—N.J.B.

Swindon, Highworth, Lechlade, Cirencester, Gloucester, Tewkesbury, Worcester, Kidderminster, Bridgnorth, Wellington, Whitchurch, Tarporley, Warrington, Liverpool.

LONDON TO NEW BRIGHTON (CHESHIRE VIA BROMSGROVE.—W.H.C.

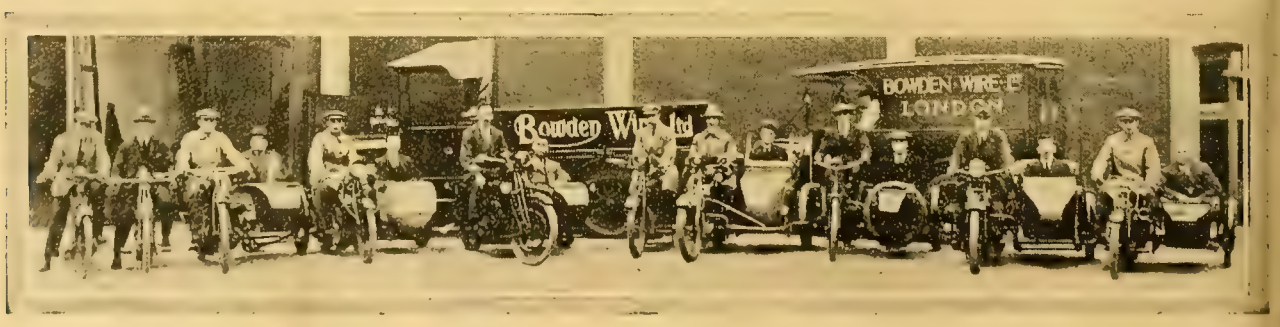
London, Watford, Aylesbury, Bicester Banbury, Stratford-on-Avon, Alcester Bromsgrove, Kidderminster, Bridgnorth Wellington, Chester, Birkenhead, New Brighton.

WHITLEY BAY TO DERBY VIA CHESTER.—H.L.M.

Whitley Bay, Newcastle, Durham, Darlington, Catterick, Boroughbridge Wetherby, Aberford, Wakefield, Barnsley, Penistone, Stockport, Northwich Chester, Tarporley, Nantwich, Stoke Leek, Ashbourne, Derby.

BIRMINGHAM TO EDINBURGH.—G.H.W.

Birmingham, Lichfield, Derby, Mansfield, Worksop, Doncaster, Ferrybridge Wetherby, Boroughbridge, Catterick, Darlington, Durham, Newcastle, Ponteland Otterburn, Hawick, Selkirk, Galashiels Stow, Edinburgh.

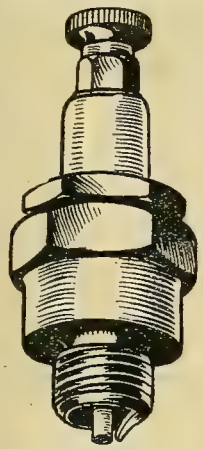


At first sight a large road staff for testing Bowden wire suggests Heath Robinson, and it may surprise motor cyclists generally to know that a really large staff is used by the makers of Bowden wire to test their various specialities. The road test is the only safe means of trying out the efficiency of anything connected with a motor cycle.

BRITISH PLUGS.

A Long Road Test of the Progress Plug.

OF recent days there has been a considerable amount of discussion with regard to the merits, or otherwise, of British sparking plugs. Some complaints have certainly reached us, and as we have in daily use an engine which quickly decides the value of a plug, and has eschewed three unsuitable articles in as many weeks, we are in a position to provide a useful test. Not long ago we obtained a new Progress plug, manufactured by W. H. Harris and Co., Upper Dean Street, Birmingham. This plug was inserted immediately before the Ilkley One Day Trial. Having successfully survived a considerable amount of low gear work in this strenuous event, the plug remained in commission for everyday use, and finally started on its adventures through the Scottish Six Days Trials. In spite of the rough treatment meted out to a "press" machine on a long and arduous trial of this description, the plug was never touched, and remains to-day apparently in as good condition as when fitted.



The Progress plug, which has a detachable steatite and central electrode.

THE "AUTOCAR" HANDBOOK.

THOSE of our readers who own cars will be interested to learn that a new and completely revised edition of "*The Autocar* Handbook" is now in the press, and that copies will be available shortly.

All the various matters relating to electrical appliances—electric engine starters, electric lighting sets, and so forth—have been brought together into a new chapter headed "Electrical Installations," and another innovation is an entirely new chapter devoted to the Ford car.

Special mention should be made of the large folding sectional view of a chassis indicating all the mechanical features of the car, which has always been a feature of the books. For this new edition—the fourth—an entirely new and up-to-date drawing has been specially prepared by the chief artist of *The Autocar*, Mr. F. Gordon Crosby.

This will form the frontispiece of the book, and is specially arranged to make it easy for reference while the book is being read. An extra chapter—explanatory of the drawing—has been inserted.

The price of the new edition will be 3s. 6d. net, or with postage 3s. 10d. Readers desirous of securing early copies should address their orders and remittances to the publishers, Iliffe and Sons, Ltd., 20, Tudor Street, London, E.C.4.

SPEED TRIALS AT WESTCLIFF-ON-SEA.

Formula Results.

WHATEVER the size of a speed trial on the point of entries, the net results are usually divided among a few competitors with exceptionally fast machines. The official results on formula of the recent Westcliff-on-Sea event show that A.B.C. machines secured thirteen firsts, James five, and the Indian four, Levis two, and the Duzmo one. Below we give the results showing the performances of individual riders and the classes in which they scored.

F. J. Boshier-Jones (3 A.B.C.), twelve firsts (members' and open events, Classes 11, 12, 13, 27, 28, and 29).

E. Kickham (2¾ Douglas), five firsts (members, Classes 16 and 26; open, Classes 10, 16, and 26), four seconds (members, Classes 10, 11, 12, and 28), and one third (open, Class 28).

W. R. Bailey (3 A.B.C.), six firsts (members, Classes 3, 4, and 20; open, Classes 3, 19, and 20) and one second (members, Class 19).

J. F. Lidstone (2¼ James), four firsts (members, Classes 2, 10, 18, and 21) and one second (members, Class 26).

H. R. Harveyson (Indian), four firsts (members, Classes 17 and 33; open, Classes 17 and 33), one second (members, Class 27), and one third (open, Class 13).

F. W. Applebee (2¼ Levis), two firsts (open, Classes 2 and 18), one second (members, Class 2), and three thirds (members, Classes 3, 18, and 19).

E. L. Gay (4 Triumph), two seconds (members, Classes 5 and 29) and two thirds (members, Classes 13 and 21).

G. E. Stobart (5-6 James), four firsts (members, Classes 8, 9, 24, and 25) and one second (members, Class 16).

E. B. Ware (2¾ N.U.T.), one second (open, Class 10) and one third (members, Class 10).

W. J. Barber (8 Henderson), three seconds (members, Classes 9, 17, and 25).

E. Porter (3 A.B.C.), two firsts (open, Classes 9 and 25).

S. L. Bailey (3½ Douglas), one third (members, Class 11).

H. Le Vack (3½ Duzmo), one first (members, Class 19), six seconds (members, Classes 3, 4, and 20; open, Classes 11, 27, and 28), and one third (open, Class 12).

H. R. King (3 A.B.C.), two seconds (open, Classes 12 and 13) and two thirds (open, Classes 11 and 27).

S. M. Greening (2¼ Diamond), one second (open, Class 2) and one third (members, Class 2).

G. Strange (3½ James), one first (members, Class 5), one second (members, Class 21), and one third (members, Class 27).

D. Crawford (Zenith), one second (open, Class 9) and one third (members, Class 25).

H. E. Alliott (2¾ Douglas), one second (open, Class 29).

C. H. Smith (4 Triumph), one third (members, Class 16).

S. C. Marshall (1½ Bunly Scooter), one first (members, Class 1).

G. A. Bray (1½ Auto Scooter), one first (open, Class 1).

SIDECAR TAXIS AT LAST.

Vehicle approved by Authorities.

A COMPANY in Nottingham is putting into service a novel sidecar taxi, seating two persons side by side. Nottingham, true to its tradition as an up-to-date city, is the first in the British Isles to adopt this innovation.

Permission was granted by the Nottingham Watch Committee with the distinct understanding that only ex-service men must be employed. The fare is to be at the old rate of 1s. for the first mile and 8d. a mile afterwards.

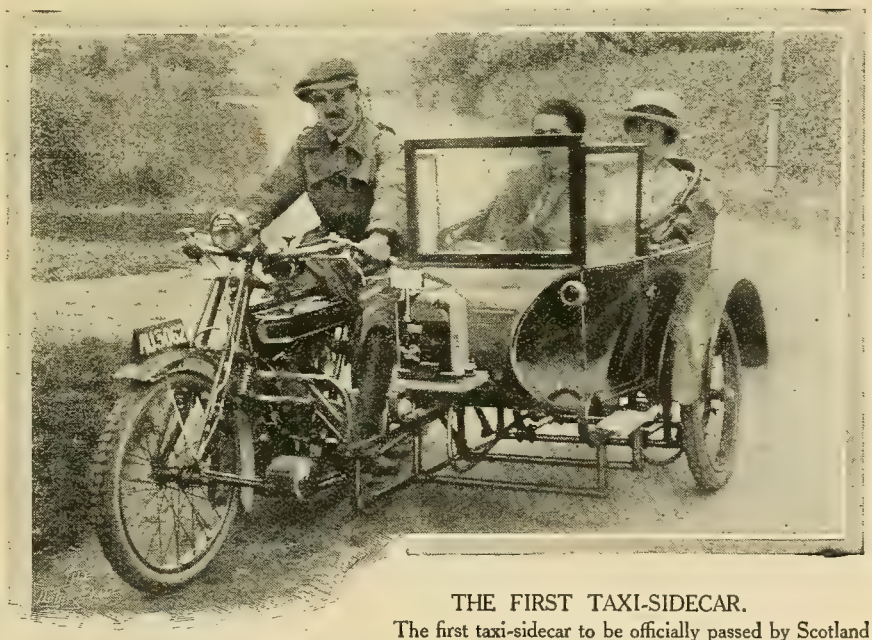
These little vehicles should be particularly adaptable to commercial travellers carrying light samples; also for touring purposes, for which special low rates will be charged.

The sidecar is fitted with a leather hood and celluloid windscreen. In addition, there are side screens that can be raised at will, and are held in position by a catch, thus making the sidecar absolutely weatherproof.

The taximeter (which is driven from the sidecar wheel) is fitted on a small platform at the front of the sidecar, so that the passenger can read the dial while seated.

The machine is a 6 h.p. Campion, and with two passengers second gear is only necessary on the steepest hills; in fact, it has been proved much handier than the ordinary taxicab.

The company intend having half a dozen outfits running within a month.

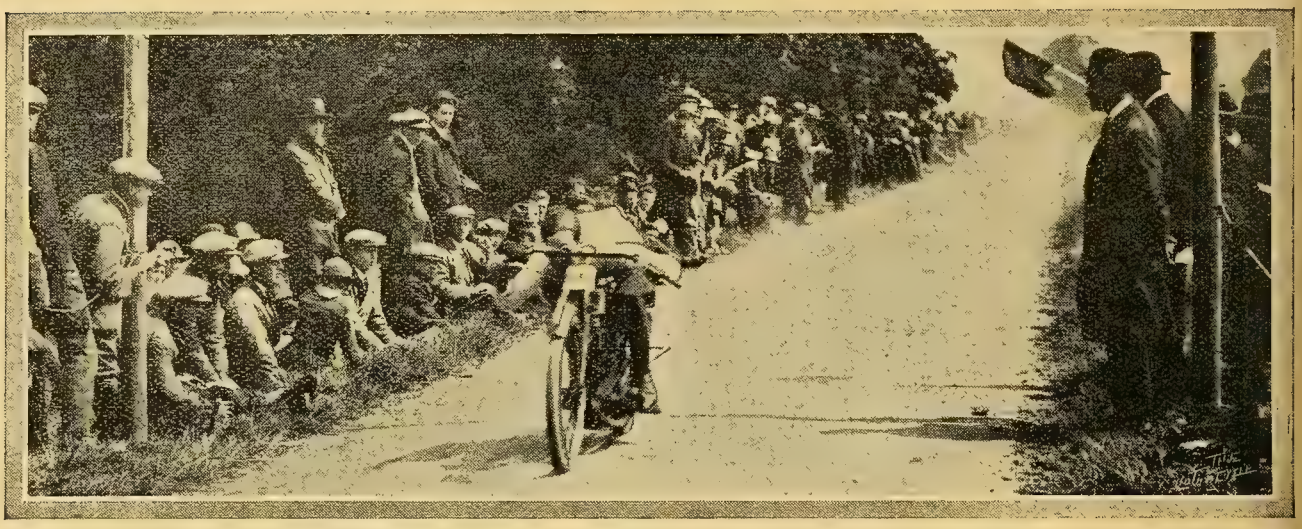


THE FIRST TAXI-SIDECAR.

The first taxi-sidecar to be officially passed by Scotland Yard. The body is of the two-seater type, and the machine a Campion.

The Luton and South Beds A.C. Speed Trials.

A Head Wind lowers Maximum Speeds.



General view of the course in Luton Hoo Park, showing the fine speedway and the large crowd which assembled to witness the racing. The rider is George Dance crossing the finishing line at 70 m.p.h. on his 2¾ h.p. Sunbeam.

THE annual open speed trials run off in Luton Hoo Park are becoming more popular every year. For Saturday's event the entries were in the neighbourhood of 200, while the excellent organisation which enabled the classes to be run off promptly, the fine though blustery weather, and the good condition of the course all helped towards the success of the afternoon. The course was half a kilometre in length, and was situated on a straight piece of road at the south end of the park. The surface was in excellent condition for an ordinary macadam road, and had not the strong north-westerly wind blown against the competitors some wonderfuly fast times would have been made. There was only just one small hitch at the beginning before the field telephone had properly settled down to work. The times were taken by Mr. J. Burley, one of the few of the older timekeepers, who is also an active motor cyclist, and who arrived in his Chater-Lea sidecar outfit. He took the times at the finish, receiving notice of the machine passing the starting line by means of a buzzer. Thanks to the excellent marshalling by Mr. W. Cooper (the A.C.U. steward) and the organising powers of Mr. J. Simpson (the hon. sec.) and his willing helpers, there were no tiresome delays. Despite the adverse wind, the speeds were remarkably good, while the chief feature of the meeting was the struggle for supremacy between Dance on the Sunbeam and Davies on an A.J.S. Both these machines and that ridden by Boston did remarkably well. Owing to the failure of the telephone, F. W. Applebee was not timed in Event 1 and had to run again. Baragwanath had the misfortune to break his piston almost on the finishing line.

There were few novel machines, but Wallace appeared with a 60° twin cylinder Duzmo, built on the same lines as the single of this make, on which he won Event 10.

Considerable amusement was caused by the first sidecar event when H. R. Davies collected a small boy as passenger, and packed him lying face downwards in the sidecar, with the result that as he passed nothing of the sidecar's occupant could be seen but two small feet.

A machine which acquitted itself very well was E. Hill's Rudge, which tied for second place with Capt. Millar's Matchless in Event 6.

Speed attracts Spectators.

As previously mentioned, some excellent times were made, but many of the lesser known riders came by at touring speed. Quite a large number of spectators arrived to witness the trials which began at 1 p.m. and finished at 5.30 p.m. There was an interval of half an hour at the conclusion of Event 7. The following were the results:

EVENT 1.—CLASS 1 (Expert and General). Machines with engines up to 275 c.c.

		Time.
1.	G. Davison (2¼ Levis)	23⅘s.
2.	J. F. Lidstone (2¼ James)	26s.
3.	W. A. Jacobs (2¼ Singer)	26⅕s.

Winner's speed, 46.99 m.p.h.

EVENT 2.—CLASS 1 (Experts barred). Machines with engines up to 275 c.c.

1.	G. Davison (2¼ Levis)	23⅘s.
2.	F. Biggs (2¼ New Hudson)	33⅕s.

Winner's speed, 47.39 m.p.h.

EVENT 3.—CLASS 2 (Expert and General). Machines with engines up to 350 c.c.

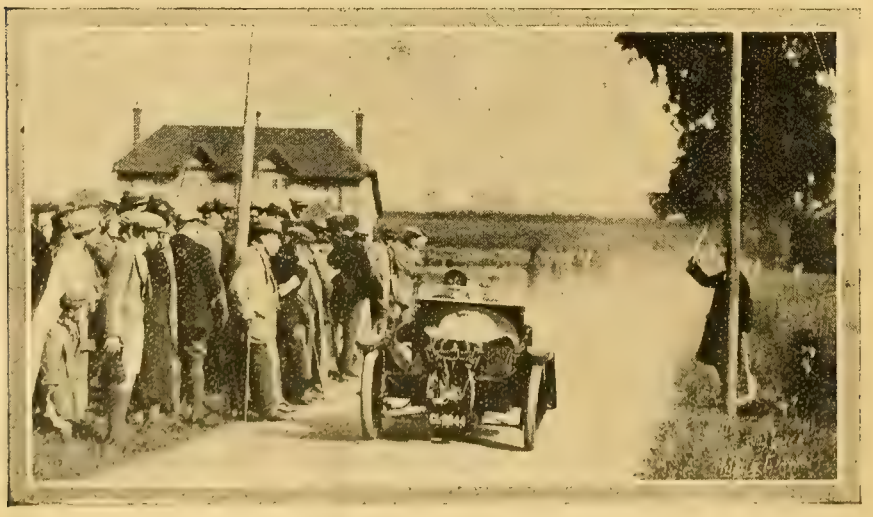
1.	G. Dance (2¾ Sunbeam)	17⅘s.
2.	H. R. Davies (2¾ A.J.S.)	18⅕s.
3.	G. S. Boston (2¾ A.J.S.)	20s.

Winner's speed, 64.28 m.p.h.

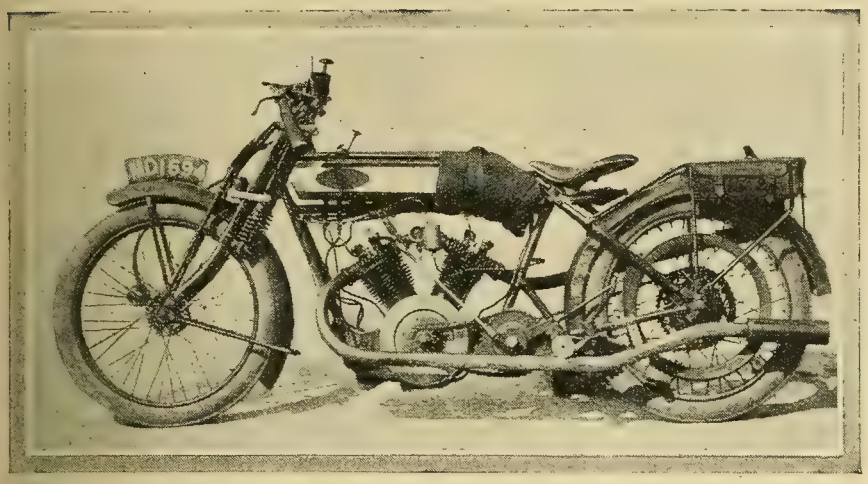
EVENT 4.—CLASS 2 (Experts barred). Machines with engines up to 350 c.c.

1.	H. R. Davies (2¾ A.J.S.)	17s.
2.	E. L. Boston (2¾ A.J.S.)	21⅕s.
3.	A. Sims (2¾ Diamond)	23s.

Winner's speed, 65.79 m.p.h.



The course was half a kilometre in length, with a flying start. P. A. Child, on a Morgan, is seen crossing the starting line. Observe the telephone operator and flagman on the right.



Another V twin with an outside flywheel. The 8 h.p. Duzmo has overhead valves, and is practically a duplication of the well-known single.

EVENT 5.—Class 3 (Expert and General). Machines with engines up to 500 c.c.

1. H. R. Davies (2¾ A.J.S.) ..... 17s.
2. G. Dance (3½ Sunbeam) ..... 17⅝s.
3. V. Horsman (3½ Norton) ..... 18⅛s.

Winner's speed, 65.79 m.p.h.

EVENT 6.—Class 3 (Experts barred). Machines with engines up to 500 c.c.

1. H. R. Davies (2¾ A.J.S.) ..... 17⅛s.
2. {Capt. Millar (3½ Matchless) ..... 22⅝s.
   {E. Hill (3½ Rudge) ..... 22⅝s.

Winner's speed, 65.03 m.p.h.

It will be noticed that in the last two events Davies beat machines in the class above him, and that his running was so consistent that of the last three events his time was identical in the first two and only varied by a fifth of a second in the third.

EVENT 7.—Class 4 (Expert and General). Machines with engines up to 750 c.c.

. G. Dance (3½ Sunbeam) ..... 17⅛s.
. G. S. Boston (2¾ A.J.S.) ..... 17⅝s.
. V. Horsman (3½ Norton) ..... 18⅛s.

Winner's speed, 65.03 m.p.h.

EVENT 8.—Class 4 (Experts barred). Machines with engines up to 750 c.c.

. E. Hill (3½ Rudge) ..... 21⅝s.
. Capt. Millar (3½ Matchless) ..... 22⅛s.
. E. L. Boston (2¾ A.J.S.) ..... 22⅝s.

Winner's speed, 52.7 m.p.h.

EVENT 9.—Class 5 (Expert and General). Machines with engines up to 1,000 c.c.

1. E. Baragwanath (8 Zenith) ..... 16⅛s.
2. G. Dance (3½ Sunbeam) ..... 17⅛s.
3. {G. S. Boston (2¾ A.J.S.) ..... 18⅛s.
   {V. Horsman (3½ Norton) ..... 18⅛s.

Fastest time of the day. Winner's speed, 69.04 m.p.h.

EVENT 10.—Class 5 (Experts barred). Machines with engines up to 1,000 c.c.

J. Wallace (8 Duzmo) ..... 20s.
W. C. Veasey (10 Henderson) ..... 20⅝s.
E. Hill (3½ Rudge) ..... 21⅝s.

Winner's speed, 55.92 m.p.h.

EVENT 11.—Class 6 (Expert and General). Scooters.

R. Whincup (1½ Whippet) ..... 45s.

EVENT 12.—Class 6 (Experts barred).

R. Whincup (1½ Whippet) ..... —

EVENT 13.—Class 7 (Expert and General). Sidecar Machines, 500 c.c.

G. Dance (3½ Sunbeam) ..... 21⅛s.
H. Davies (2¾ A.J.S.) ..... 22⅛s.
E. L. Boston (2¾ A.J.S.) ..... 27⅝s.

Winner's speed, 51.31 m.p.h.

EVENT 14.—Class 7 (Experts barred). Sidecar Machines up to 500 c.c.

H. R. Davies (2¾ A.J.S.) ..... 22s.
E. L. Boston (2¾ A.J.S.) ..... 26⅛s.
G. Davison (2¾ Diamond) ..... 32s.

Winner's speed 50.34 m.p.h.

EVENT 15.—Class 8 (Expert and General). Sidecar Machines up to 750 c.c.

1. G. Dance (3½ Sunbeam) ..... 21⅛s.
2. H. Davison (2¾ A.J.S.) ..... 22⅝s.
3. G. E. Stobart (5-6 James) ..... 23⅝s.

Winner's speed, 52.27 m.p.h.

EVENT 16.—Class 8 (Experts barred). Sidecar Machines up to 750 c.c.

1. H. R. Davies (2¾ A.J.S.) ..... 22s.
2. H. Reyre (5-6 James) ..... 25⅛s.
3. E. J. Boston (2¾ A.J.S.) ..... 27⅛s.

EVENT 17.—Class 9 (Expert and General). Sidecar Machines up to 1,000 c.c.

1. G. Dance (3½ Sunbeam) ..... 21⅛s.
2. G. Stobart (5-6 James) ..... 25⅛s.
3. E. Baragwanath (8 Zenith) ..... 25⅛s.

Winner's speed, 50.76 m.p.h.

EVENT 18.—Class 9 (Experts barred). Sidecar Machines up to 1,000 c.c.

1. H. Reyre (5-6 James) ..... 25⅝s.
2. W. J. Barker (10 Henderson) ..... 26⅝s.

Winner's speed, 44.03 m.p.h.

EVENT 19.—Class 10 (Expert and General). Cycle-cars.

1. P. A. Child (8 Morgan) ..... 30⅝s.
2. S. Hall (8 Morgan) ..... 31⅛s.

Winner's speed, 36.79 m.p.h.

EVENT 20.—Class 10 (Experts barred). Cycle cars.

1. F. A. Child (8 Morgan) 29⅛s
2. P. A. Child (8 Morgan) 30⅝s

Winner's speed, 37.53 m.p.h.

The competition was run in Luton Hoo Park by the kind permission of Lady Ludlow, who is distributing the sum obtained from the admission fees to the park to local charities.

Awards.

Gold, silver, and bronze medals were awarded in all classes in which there were nine entries, gold and silver medals when there were five entries, and if only three entries were received for a class bronze medals. Special prizes are to be awarded to the competitor making the fastest time of the day in the expert and also in the expert barred classes. A special prize, value two guineas, is to be awarded by Mr. P. A. Child to the competitor making the fastest time of the day, and residing within a radius of ten miles of Luton.

HILL-CLIMB AT SOUTH HARTING.

ON Saturday last the Junior Car Club held a successful hill-climb at South Harting in which there were included several classes for cycle cars. The following are the results :

CLASS 1.—Three-wheeled Cycle Cars, engine not exceeding 1,100 c.c.; passenger to be carried: W. D. Hawkes (Morgan), only runner.

CLASS 2.—Touring Two-seaters, engine not exceeding 1,100 c.c.; passenger to be carried: 1, G. H. Tamplin (8 Tamplin); 2, S. Watson (10 Deemster); 3, C. Finch (10 G.N.).

CLASS 5.—Lady Drivers: 1, Mrs. A. Warren Lambert (10 Warren Lambert).

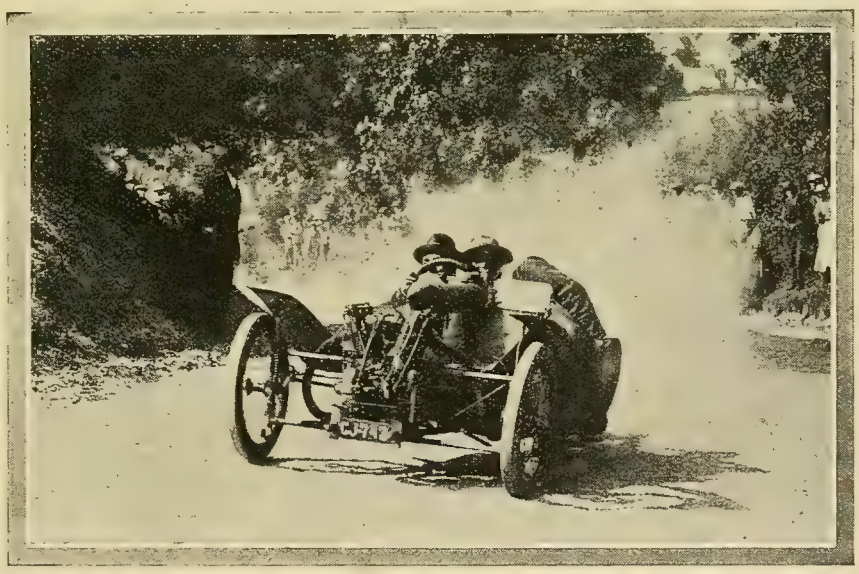
CLASS 6.—Monocars regularly sold and used as Single-seaters, engine not exceeding **1,100 c.c.**: 1, Kaye Don (8 Tamplin).

CLASS 7.—1,100 c.c. Racing Cars: 1, A. F. Nash (10 G.N.); 2, H. R. Godfrey (10 G.N.).

CLASS 9.—Sporting Cars; a passenger to be carried: 1, T. Gilmore Ellis (8.7 G.N.); 2, H. R. Godfrey (10 G.N.-Vitesse).

In Class 7 W. D. Hawkes blew off a cylinder while travelling at speed.

South Harting is an admirable venue for an event of this nature. The scenery is beautiful and the hill sufficiently steep.



A sporting three-wheeler on South Harting. W. D. Hawkes taking the bend at speed on his special o.h.v. Morgan-Jap.

A LIGHTWEIGHT TRIAL.

Successful Week-end Event organised by the Birmingham Club.

THAT the Birmingham M.C. was able to secure an entry of over twenty riders for its lightweight trial last week-end shows that the junior machine is no longer regarded as a runabout unsuitable for serious touring.

In addition to the twenty machines of under 300 c.c. there were several others, which only exceeded the limit mentioned by a few cubic centimetres, in the touring trial, which was run concurrently with the lightweight event.

Starting at 2.30 p.m. from Birmingham on Saturday, the competitors had to maintain an average of 20 m.p.h. over a main road course which included Rose Hill, Bromsgrove, Worcester, the Old Wyche at Malvern, Colwall, Ledbury, Ross, Whitchurch, Monmouth, Bigsweir Bridge, Tintern to Chepstow, while the return, next day, also started at 2.30, and took in Lydney, Blakeney, Newnham-on-Severn, Gloucester, Birdlip Hill, Cheltenham, Rising Sun, Winchcombe, Sudeley Hill, a short "colonial" section to Snows Hill, Broadway, Stratford-on-Avon and Henley-in-Arden; a total mileage of seventy-six and fifty-one miles respectively.

English Weather.

The first day's run was in splendid weather, and competitors were able to see the Wye Valley at its best; but the conditions for the return were not so propitious, high winds and heavy rain prevailing all day.

Rose Hill, a few miles from the start, accounted for one failure only—H. C. Jennens (2¼ James) had a socted plug, but there were many failures on the Old Wyche. On the other hand, Birdlip, as severe as it is, troubled none of the miniatures, but these, however, found Rising Sun very trying in the rain. Several competitors who afterwards made a good climb of the worst part of the gradient stopped on the lower portion through wheel spin and skids, as the grease was indeed very bad.

Individual Performances.

As usual the Levis machines performed conspicuously. E. J. Bastock (2½ Levis) climbed the hills mentioned splendidly, as did Edwards on a 2¼ h.p. model, and R. E. Pugh, but R. Urwin (2½ Levis), after successfully ascending the Wyche and Birdlip, got into a gulley on Rising Sun, and could not recover his speed. G. Kuhn as usual made good ascents. He toured up Birdlip and reserved plenty of power with which to accelerate on the top bend. Some of the machines were slightly under-powered for their weight. The development of the true lightweight is bound up in its weight, and this lightweight trial demonstrated the value of light weight, for the machines that are the most successful at hill-climbing were lighter than others which were unduly handicapped by heavy frame construction.

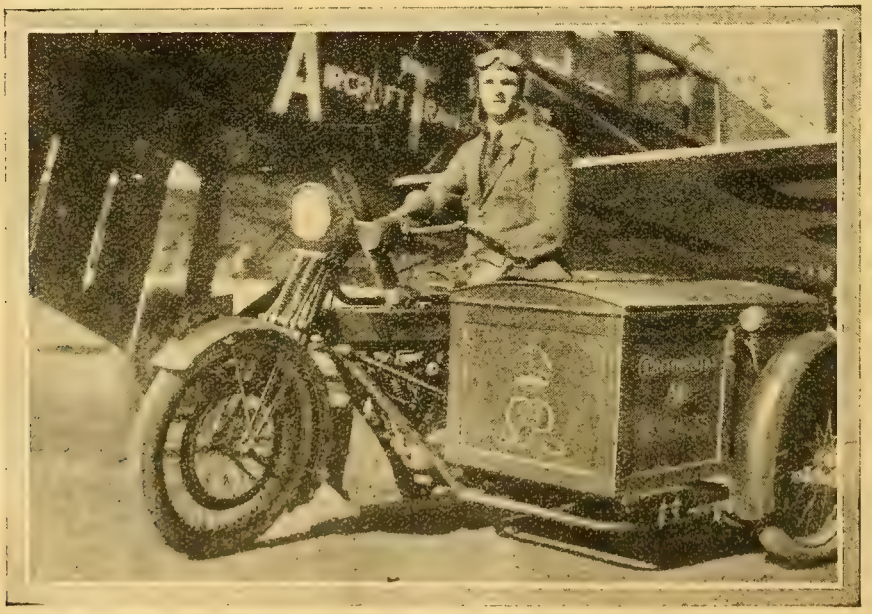
On the Old Wyche and on Rising Sun H. C. Jennens (2¼ James) was forced to run beside his machine, not because his engine lacked the power which had carried others up with ease, but because it was asked to do more. V. Williams and F. Povey, on similar machines, repeated Jennens's performance.

J. C. Walker (2½ Edmund-Jap) climbed the three hills in good style, but the riders of the two Sun V.T.S. machines were not so fortunate. J. W. Parkes broke a chain on the Wyche, was good on Birdlip, but had to use his feet on Rising Sun. F. C. Parkes, similarly mounted, paddled on the first and last mentioned, but made a splendid ascent of Birdlip.

The little Velocette machines were splendid with G. Denley and Eric Williams in the saddles. They created a very good impression on all the hills, which they climbed with ease.

B. Kershaw, on the smallest of the Verus models, also performed well, but G. Smith (2¼ Clyno) had to run beside his mount on the Wyche, and made a steady ascent of Birdlip. The younger Haden (who ran so steadily in the T.T.) had to paddle on the Wyche, made a clean ascent of Birdlip, and was exceptionally good on Rising Sun.

To summarise the trial, one may say that for all but such severe acclivities as the Old Wyche and Rising Sun, all the lightweights in the trial proved themselves capable, and that too heavy construction was responsible for most of the failures on the hills mentioned.



A MAIL TENDER. Considering the economy of the modern sidecar, it is surprising that more are not used for rural mail service. Before the war there were many in use, and above is depicted a Royal Enfield used as a tender between the G.P.O. and the Croydon Aerodrome, carrying mails for despatch by aerial post.

ANOTHER SCOTTISH TRIAL.

FOLLOWING upon the success of the Scottish Six Days Trial, the organisers — the Edinburgh and District Motor Club, Ltd.—have decided to hold a two days Highland Trial, which might be described as a Scottish Six Days in condensed form. This trial is to be held September 18th to the 20th—the Scottish autumn holiday. On Saturday, the 18th, the competitors will leave Edinburgh and proceed *via* Stirling, Amulree, Kenmore, Killin, Crianlarich, Arrochar, Inveraray, Cladich, Dalmally, Taynuilt, Connel to Oban, approximately 190 miles. Sunday is to be spent in the last-named beautiful Highland resort, the competitors thus obtaining a day of rest.

The return route on Monday will be as follows: Oban, Connel, Ballachulish, Glencoe, Tyndrum, Crianlarich, Lochearnhead, Callander, Stirling to Edinburgh.

It is fully expected that a large number of riders who took part in the Scottish Six Days will participate in this event, which possesses unique and sporting attractions, and which, we understand, will become an annual trial. Further particulars can be obtained from G. Graham Davidson, Hon. Trials Secretary, Edinburgh and District Motor Club, Ltd., 6, Castle Terrace, Edinburgh

Owing to the numerous breakages of axles, etc., police are now stationed daily at each end of the Sevenoaks Road at Bromley Common warning motorists to slow down owing to the bad state of the road. It is said the Council cannot obtain stone for repair owing to transport difficulty. The bad stretch extends from the "Crown" public house to the junction of the Westerham Road. To avoid Bromley Common, motor cyclists should travel *via* Hayes Lane, Hayes Common, cross the Westerham Road and rejoin Sevenoaks Road at Farnborough.

CURRENT CHAT

Times to Light Lamps.

July 29th	... ...	9.22 p.m.
,, 31st	... ...	9.19 ,,

,, 4th	... ...	9.12 ,,

Tandem Miniature.

The tandem seater scooter is the latest development of the miniature machine.

Flat Twins interest A.C.U. Royal Patron.

H.R.H. the Duke of York recently visited the A.B.C. works. It will be recalled that His Royal Highness rides a Douglas.

French Design.

As will be seen from the article appearing on pages 122 to 124, the French motor cycle industry has been very busy since the Armistice. Unconventionality without any suggestion of freakishness appears to be the keynote of French design.

Police Sidecars in Paris.

It has been decided that the Paris traffic police shall be provided with twelve motor cycles and sidecars. The use to which these will be put is not to chase speedsters, for Paris has never known a definite speed limit, but to maintain a general control over traffic and to be made use of for very rapid transportation.

Martin Motor Cycles.

Mr Harry Martin, who is one of the oldest of British motor cycle racing men, is about to recommence the manufacture of Martin motor cycles, and will specialise in the production of 750 c.c. twin-cylinder speed models with M.A.G. engines and 1,000 c.c. machines fitted to sidecars. The offices of the new company, which are under the direction of Capt. Sir A. J. Millar, Bart., are 60, Cheval Road, Brompton Road, London, S.W.1. The new Martin Works are to be in London.

An A.A. Filling Station in the North.

The Automobile Association is extending its benzole filling station activities still further afield, and the latest depot to be opened is situated in West Yorkshire at Bramham cross-roads, on the Leeds-York and Great North Roads. The opening took place at 3 p.m. on the 21st inst., and was largely attended by representatives of the benzole industry, the A.A, and the motor traders in Yorkshire. Amongst the first four motorists to obtain replenishments from the benzole tank installation were A. Jenkins (Triumph) and N. O. Vinter (Scott).

The Price of Petrol.

Petrol has gone up to 40 cents (approximately 2s.) per gallon in the U.S.A. Does this pre-shadow another rise in this country?

Found.

A set of motor cyclist's overalls were recently picked up by Mr. T. A. Thompson, Bank House, Burtonwood, Newton-le-Willows, Lancs., between Earlestown and St. Helen's Junction.

New Vulcanising Process.

The rubber industry was founded in Manchester by Macintosh in 1825. A lecturer in chemistry—Mr. Peachey—of the Manchester School of Technology has now discovered a method of cold vulcanisation by means of two gases.

Club Race at Brooklands.

A race for members of the Public School M.C.C. will be held at Brooklands in connection with the meeting on August 18th. The race will be open for all classes of machines. A cup will be given to the winner and prizes for second and third men; in addition, club prizes which shall carry with them the club class championship will be given to the fastest in each class.

Special Features.

MOTOR CYCLE DESIGN IN FRANCE.
WEEK-END EVENTS.
AUSTRALIAN MOTOR CYCLES.

A New Fuel.

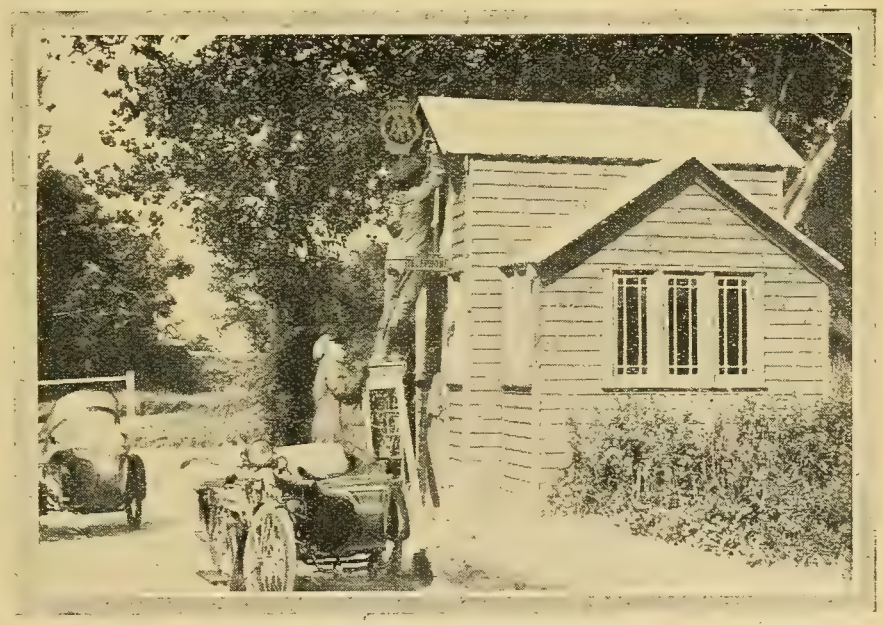
The latest attempt to produce a new motor fuel has been made by a resident of South Africa; it is to be called Acetol.

The 1920 Grand Prix Circuit du Mans.

Thirty-one entrants have been received for the motor cycle class, and twenty-two for the Cycle Car Grand Prix Race to be held near Le Mans on August 28th, making fifty-three entries in all.

Provisional Results of Lakeland Trial.

The following riders completed the course of the recent Cumberland County M.C.C. One Day Reliability Trial without loss of marks: E. Williams (3½ Sunbeam), R. E. Darnton (7-9 Indian), J. A. Newman (3½ Sunbeam), W. G. Harrison (3½ Sunbeam), J. W. Wills (2¾ Verus), I. H. Dickson (7 F.N.), S. Bell (3 A.B.C.), R. L. Williamson (3½ Norton), T. C. de la Hay (3½ Sunbeam), G. W. Wilkin (2¾ Wilkin), and S. Parker (8 Royal Enfield sc.).



THIRD A.A. ROADSIDE BENZOLE FILLING STATION. A road guide is seen fixing up the sign on the filling station, which was recently opened at the Bramham cross roads (Leeds-York and Great North Roads), a busy spot in Yorkshire.

A TEAM TRIAL IN LANCASHIRE.

Twenty Teams, representing Eleven Clubs, compete for the Blake Challenge Cup.

ALTHOUGH the district in which they are situated presents anything but ideal conditions for the enjoyment of a motor cycle, the clubmen embraced in the North-Western Centre of the A.C.U. are none the less keen.

In consequence of this keenness, eighty riders (pure amateurs for the most part) faced the starter last week-end in the Town Hall Square, Bolton, each anxious to uphold the standing of his club. The event holds the distinction of being the first separate inter-club team trial organised by an A.C.U. "centre."

At Rivington Pike.

The route from Bolton led towards the foothills of the Pennines and the first, and as it proved the most severe hill of the day was climbed about six miles from the start. Although the gradient of Rivington Pike does not appear to be very severe, it is deceptive, and quite a number of even high-powered machines failed before reaching the first hairpin of the three at the top. The chief troubles appeared to be due to nervousness on the part of the riders when they approached the roughly paved cross-gulleys or the hairpin corners, and there was also great dissimilarity in the manner in which machines of identical specification were handled. Thus E. Foster's Scott was knocking badly on the first hairpin, while N. S. Walsh on a similar model came up quite easily. R. Lock's 3½ h.p. Coventry-Eagle had ample power, but the rider himself appeared to be nervous. P. Dalton (4 Triumph) and S. Parker (3½ Wilkin sc.) made very steady ascents, as did N. Houlding on a 3 h.p. Cleveland. One or two sportsmen started out on single gears, and of these G. Brill (4 Triumph) came up at great speed, picking his way round the hairpins. E. F. Ganton on a 3½ h.p. Duzmo was not successful, however, the last hairpin proving too much for his one gear. Amongst others who made nice climbs were J. Butterworth (5-6 James sc.), H. R. Caldwell (8 Martinsyde sc.), W. Greenaway (4¼ L.M.C.), and J. Collinson (6 Ariel sc.).

Beyond Rivington some wild moorland scenery was passed, and then a variety of roads (pot-holes, *pavé* and excellent Tarmac) were traversed through Whalley and Bolton-by-Bowland to the lunch stop at Whitewell. Each team of four (two solos and two sidecars) had to complete the course absolutely non-stop, with the exception of the observed hill, where a stop entailed the loss of five marks.

Three Hairpins.

From Whitewell, which is one of the beauty spots of the North-East Lancashire uplands, an exceedingly stiff test had been devised. The observed hill commenced as soon as the riders crossed the starting line, and although the gradient was not abnormal, a succession of three acute hairpin bends, taken before the engines had chance to warm up, was very trying.

The first man away, W. Richards (3½ James), made an excellent climb, as did W. R. Eadington (3½ Sunbeam sc.); the latter's lady passenger is an adept at cornering, and leaned out in the style which used to be known as "Weatherilting." The 5-6 h.p. James sidecar was again exceptionally good, and G. Ormerod, who was driving quite an old 5-6 h.p. A.J.S. sidecar, made a splendid ascent. Amongst the solo riders R. S. Jackson (4 Triumph) calls for special comment, while B. Caldwell (3½ Norton), after taking the corners steadily, accelerated at a great pace up the hill—his machine was very noisy, however. T. G. Pearn (3½ N.U.T.) made a smooth climb, and M. Booth (5-6 Indian) and S. A. Marks (7-9 Indian sc.) both did well. After leaving the top of the observed hill a rough and grassy descent of great steepness was taken. It was one of the kind of hills at the foot of which one expects a watersplash, but, fortunately, the coast was clear. No more serious hills were encountered on the forty-five miles run home, but many miles of greasy lanes were traversed. The fine weather of the morning had changed to a steady downpour, and everyone who finished was damped in everything but spirit.

The trial was a great success in every way, the course was well arrowed, and the arrangements generally reflect great credit on the organising secretary. Future competitions should be well supported.

W. Howarth (5-6 Indian sc.) following an official Morgan near the top of Rivington Pike.

A Team Trial in Lancashire.—

The following is a list of the teams that started; an asterisk marks those who retired:

WARRINGTON M.C.—TEAM 1: R. S. Jackson (4 Triumph), B. Caldwell (3½ Norton), J. Roberts (6 A.J.S. sc.), and *J. B. Terras (6 Bradbury sc.). TEAM 2: T. G. Pearn (3½ N.U.T), H Aldred (4 Triumph), H. Wragg (8 Sunbeam sc.). and J. Massey (8 Royal Ruby sc.).

EAST LANCS. M.C.C.—N. Houlding (3 Cleveland), C. Pilling (3½ Norton), B. Houlding (4 Norton sc.), and S. A. Marks (7-9 Indian sc.).

STALYBRIDGE AND DISTRICT M.C.C.—*G. E. Watts (3½ Ariel), *A. Watts (7-9 American X), *A. Green (7-9 American X sc.), and L. Mercer (6 British Excelsior sc.).

N. CHESHIRE M.C.—M. Booth (5-6 Indian), R. Lock (3½ Coventry Eagle), W. R. Eadington (3½ Sunbeam sc.), and *O. Jessop (4 Triumph sc.).

BURNLEY AND DISTRICT M.C.—TEAM 1: *E. Rigg (2¾ New Imperial), *J. W. Windall (2¾ New Imperial), *H. Pool (6 Enfield sc.), and *E. Pool (4¼ B.S.A. sc.). TEAM 2: *J. Swindlehurst (3½ Bradbury), *J. B. Walton (2½ Connaught), J. Collinson (6 Ariel sc.), and *W. Nutter (6 Bradbury sc.). TEAM 3: W. Greenaway (4¼ L.M.C.), *H. Holden (2¾ Aurora), J. Hartley (8 Ruby sc.), and P. Duckworth (8 Dot sc.).

BURY AND DISTRICT M.C.—TEAM 1: M. Parkinson (3½ Rudge), J. W. Glover (3½ Sunbeam), J. Whittaker (4 Triumph sc.), and G. Ormerod (6 A.J.S. sc.). TEAM 2: C. Lord (3½ Sunbeam), N. S. Walsh (3¾ Scott), W. Howarth (5-6 Indian sc.), and *J. L. Houghton (5-7 Dalton sc.). TEAM 3: P. Dalton (4 Triumph), H. Compton (3½ Sunbeam), J. Knowles (4 Triumph sc.), and O. Entwhistle (3½ Sunbeam sc.).

BOLTON AND DISTRICT M.C.C.—TEAM 1: W. Richards (3½ James), C. Guthrie (3½ Norton), *H. Jackson (8 Matchless sc.), and C. Scowcroft (8 Enfield sc.). TEAM 2: L. Hargreaves (4 Harley), J. Hardy (4 Norton), J. Cottam (6 A.J.S. sc.), and P. Vickers (8 Matchless). TEAM 3: J. Dunning (4 Douglas), A. Roberts (2¾ Bown-Villiers), M. Brown (10 Merrall-Brown), and A. Horrocks (10 Morgan).

MANCHESTER M.C.—TEAM 1: E. F. Ganton (3½ Duzmo), E. Bottomley (7-9 Harley), T. E. Williams (6 Bradbury sc.), and *E. Gill (6 Bradbury sc.). TEAM 2: *J. S. Clayton (4 Harley-Davidson), H. Clayton (3½ Marlow), G. Calf (8-10 Henderson), and G. Cowley, junr. (6 A.J.S. sc.). TEAM 3: E. Foster (3¾ Scott), G. Brill (3½ Triumph), *O. E. Carter (3½ A.B.C. sc.), and *J. W. Clayton (8 Morgan).

J.B. CLUB (Liverpool).—TEAM 1: N. E. Williams (3½ Beardmore-Precision), H. T. Williams (7-9 American X), *S. Parker (3½ Wilkin sc.), and J. N. Green (6 Martinsyde sc.). TEAM 2: R. R. Bromley (4 Triumph), *N. Dean (3½ Wilkin), C. Harper (4 Triumph sc.), and H. R. Caldwell (6 Martinsyde sc.).

WIDNES M.C.—*H. Hodgson (3½ Rudge), W. Cook (4 Triumph), A. J. Bailey (4 Norton sc.), and J. H. Sandland (8 Morgan).

A.C.U. NOTES AND NEWS.

Next Year's T.T. Class for 250 c.c. Machines retained. Hills in the Six Days Trial. Entries to be Limited.

Next Year's T.T.

AFTER careful consideration of all the lessons to be learnt from this year's Motor Cycle Tourist Trophy Races, not only as regards the "improvement of the breed," but also the question of safety and the debatable point as to whether a machine should be obliged to finish under its own power, the Competitions Committee of the Auto-Cycle Union has unanimously recommended that a Junior and Senior T.T. Race be held in the early summer of 1921 over the same course and under the same conditions as this year. The total number of motor cycles that will be accepted for next year's races will be limited to one hundred in each of the two races, and applications for entry may be made forthwith. It is proposed that in the Junior Race there shall again be a class for 250 c.c. machines, as proved so successful last June.

Six Days Trial. Special Prizes to be Awarded.

The Auto-Cycle Union desires to notify intending competitors in the forthcoming Six Days Reliability Trial that a number of special prizes have now been offered in connection with this event. A prize will be awarded in each class for the best performance on formula for the hill-climb up Holme Moss. A team prize is offered for the best performance by a team of three private owners riding the same make of machine, another team prize for the best performance by a team of three trade riders on the same make of machine and a third team prize for the best performance by an amateur team of three private owners nominated by an affiliated club and consisting of riders of one three-wheeler and two solo motor cycles. Finally, a special prize is offered by Messrs. C. W. Smith (Darlington), Ltd., for the best performance by a member of the North-Eastern Automobile Association. These special awards will, no doubt, add considerably to the general interest in this classic reliability trial.

Whitewell Inn, a pretty rendezvous in north-east Lancashire. The lunch stop in the North-western Centre (A.C.U.) inter-club team trial

Principal Hills.

The principal hills in the trial will be Rosedale Bank, near Rosedale Abbey, Boltby, Park Rash, Whiteshaw Moss, and Buttertubs Pass.

First List of Entries.

W. A. Fell-Smith (8 Blackburne sc.).
A. S. Guthrie (3½ Sunbeam).
L. G. Bachelier (8 Blackburne sc.).
D. F. & M. Engineering Co.—
F. J. Price (2¼ Diamond).
H. W. Merrill, jr. (3 A.B.C.).
G. Packman (8 Matchless sc.).
R. H. Baxter (2¼ Radco).
New Rover Cycle Co.—
W. Brandish, jr. (5 Rover).
D. H. Noble (5 Rover).
G. Featherstonhaugh (3½ Rover).
A. Wilkes (3½ Rover).
R. C. Winn (3 A.B.C.).
E. A. Edwards (3½ Nut-Jap).
D. A. Atkin (5 Rover).
G. S. Astley (5 Rover).
G. L. White (5 Rover).
New Imperial Cycles, Ltd. (three entries).
John Marston, Ltd.—
G. Dance (3½ Sunbeam).
F. C. Townshend (3½ Sunbeam).
T. G. de la Hay (3½ Sunbeam).
J. Joynson (5 Coventry Victor sc.).
F. J. Ellis (7 Matchless sc.).
G. D. Hardee (7 Matchless sc.).
C. Moser (4 Triumph).
W. McLelland (4 Norton).
D. L. Gregg (3½ Sunbeam).
W. Westwood (4 Triumph).
A. G. Ashley (6 L.M.C.).
James Cycle Co.—
G. A. Strange (3½ James).
G. E. Stobart (7 James sc.).
J. F. Lidstone (2¼ James).
R. E. Darnton (7-9 Indian).
Triumph Cycle Co.—
F. G. Edmond (4 Triumph sc.).
H. Green (4 Triumph sc.).
T. J. Shemans (4 Triumph).
Sopwith Aviation Co.—
—— (A.B.C. sc.).
—— (A.B.C. sc.).
—— (A.B.C.).

ACROBATICS ON A FREAK HILL.

AFTER the recent strenuous Cumberland one day trial, arguments arose as to the possibility of making a clean ascent of the famous Blea Tarn Pass. The competitors had descended this hill in the course of the event, and on the morning following a party of enthusiasts journeyed to the Pass.

A wonderful ascent was made by G. Dance (3½ Sunbeam), who rode in his well-known style, and took the hill very fast on second gear. Eric Williams made an equally good climb, though not so fast; de la Hay, Newman, and Barnard, all riding Sunbeams, also made light of the hill. J. Westwood Wills put up a remarkably fine performance in view of the fact that he was riding a low-powered machine (2¾ h.p. Verus-Blackburne).

This climb is essentially a solo performance, but nevertheless S. Parker (8 Enfield sc.) made a clean ascent, but a Morgan suffered from wheel slip. After all had made successful climbs, these sportsmen again ascended, this time carrying pillion passengers, whilst G. Dance returned down the hill standing on his saddle, and great excitement prevailed amongst the spectators when he commenced and actually made a clean ascent in this fashion. While exceedingly spectacular, this form of riding is not to be recommended for amateurs.

CLUB NEWS.

Worcester and District M.C.C.

On August 7th, a one day reliability trial will be held over a strenuous 115 mile course. Two cups and several gold, silver and bronze medals will be awarded.

Gorseinon and District M.C.C.

A rough course of one and a half miles on the Mount Hill, Gowerton, was selected for the recent club hill-climb. Three classes were run off, and the large crowd of spectators showed great interest in the proceedings. Results: Class 1, lightweights, D. Jones (2¾ Juno); Class 2, unlimited solo, R. Thomas (7-9 Harley-Davidson); Class 3, unlimited sidecars, W. Firth (6 Enfield sc.).

North London M.C.C.

The eighty-mile reliability trial for the Maybury Trophy (value 25 guineas), presented by the H.C. Motor Co., of Gt. Portland Street, W.1, will take place on August 2nd, over a strenuous course in Bucks., starting at 1 p.m. from Amersham. Brakes of competitors' machines will be officially inspected prior to the start, as several very steep descents will have to be negotiated.

Sheffield and South Yorks M.C. and L.C.C.

Recently this club held a reliability trial for the Nixon Trophy, over a rough forty-eight mile course, starting from the Bell Hagg Inn, Sheffield. The weather was anything but favourable, and no competitor succeeded in finishing with a clean sheet. Results: First, A. Blake (Morgan); second, F. W. James (6 Williamson sc.); third, P. Moon (3½ Rudge).

Doncaster M.C.C.

Despite the rain which fell persistently all the morning, a large number of members and friends assembled at the club headquarters for the run to Roche Abbey, on the occasion of the gymkhana recently held by the above club. A varied programme was arranged, including a horse-power judging test for ladies, which proved very amusing.

Sutton M.C.C.

A keenly contested hill-climb at Newlands Corner between the Sutton Horsham clubs was run off on the 18th inst. The results were as follow:

275 c.c. Class.—Quick (2½ Sun), 1m. 1⅘s.; Long (2¼ Levis), 1m. 10s.
350 c.c. Class.—Pritchard (2¾ New Imperial), 56⅘s.; Holmes (2¾ Douglas), 1m. 4s.
500 c.c. Class.—Knight (3 A.B.C.), 38⅘s.; Turner (3 A.B.C.), 43⅘s.
700 c.c. Class.—Dawborn (4 Triumph), 50s.; Engle (4 Douglas), 58⅘s.
Sidecar Class.—Goodridge (8 New Imperial sc.), 1m. 2s.; Coe (4 Triumph sc.), 1m. 9s.
Fastest Time of Day.—Knight (3 A.B.C.), 38⅘s.

West Fife M.C.

The recent hill-climb held at Cleish (Kinross-shire) attracted thirty entries in the various classes, and, although marred to some extent by rain which fell fairly heavily during the evening, the event was carried through very successfully. A crowd of several hundred spectators witnessed the ascents from various points of vantage. Results.

350 c.c. Class.—W. Blair, jun. (2¾ Douglas).
600 c.c. Class.—A. Brown (3½ Norton).
Unlimited Class.—A. Brown (3½ Norton).
Unlimited Sidecars.—C. Cordoser (7-9 Harley-Davidson).

Coventry and Warwickshire M.C.

The hill-climb to be organised by this club will take place on September 4th. The venue will be Stile Cop.

The Northern M.C.

It has been decided that in future premier awards of cups and trophies will be made only for amateur performances. Machines entering for competitions must be ridden without any previous alteration of sprockets, etc.

Newcastle and District M.C.

The club has been compelled by circumstances to abandon its intention to run the 200 guinea Travers Trophy for a hill-climb during the present year. Messrs. Travers have agreed that the trophy shall be utilised for a club reliability trial this summer, and it is hoped that next year the trophy will be available for an open hill-climb.

Amersham, Chesham, and District M.C.C.

Two events were recently held by this club—a hill-climb on Mafels Hill and a short petrol consumption trial, the results of which were as follow:

Hill-climb.—350 c.c Class: 1, H. Robinson (2¾ Douglas), 18s.; 2, Freme (2¾ Douglas); 3, A. Howard (2¾ Douglas). 500 c.c. Class: 1, G. A. E. Ward (3½ Rudge), 17⅘s.; 2, J. Murfey (3½ Triumph); 3, W. H. T. Ward (3½ Rudge). Unlimited Class: 1, V. K. Goodwin (4 Triumph), 15⅘s.; 2, G. A. E. Ward (3½ Rudge); 3, J. Murfey (3½ Triumph).

Consumption Trial.—1, W. H. T. Ward (3½ Rudge), 188 m.p.g.; 2, H. Robinson (2¾ Douglas), 168 m.p.g.; 3, J. Murfey (3½ Triumph), 160 m.p.g.

Week-end Club Events.

July 30.—Ealing and District M.C.C. London-Holyhead Trial.
July 31.—Cumberland County M.C.C. Social Week-end.

Birkenhead M.C.C.

Motor cyclists in Birkenhead and the surrounding districts who are interested in the formation of this club should communicate with Mr. T. Amery, the Oxton Cycle and Motor Works, 1a, Village Road, Oxton.

Stevenage and North Herts M.C. and L.C.C.

A large number of motor cyclists assembled at the first meeting of the new club when the following officers were elected: Captain, Mr. S. Hall; vice-captain, Mr. W. Sworder; and hon. secretary and treasurer, Mr. A. Egan.

Any motorists desirous of becoming members should communicate with the hon. sec. at the Sun Hotel, Stevenage.

Berwick and District M.C.

At a well attended meeting held recently, it was unanimously agreed to form a motor club for Berwick and district. Officials were duly elected, and it was decided to affiliate the club to N.E.A.A. Over forty members have already been enrolled. Mr. Gore, 42, Castlegate, Berwick, is the hon. secretary, to whom all communications should be addressed.

Dewsbury and District M.C.C.

Seven competitors out of sixteen starters finished in the recent 100 mile reliability trial for the Fitton Trophy, over main roads in Upper Wharfedale, Yorkshire.

The order of finishing was as follows: 1st, J. F. Groocock (4 Triumph), winner of Fitton shield; 2nd, H. H. Smith (6 Enfield sc.), awarded the "Pelican" prize; 3rd, A. Oates (4 Triumph); 4th, J. Asquith (3½ P. and M.); 5th R. Halliday (3½ P. and M.); 6th, A. E. Scayill (6 Enfield sc.); and 7th, F. Bray (4 Triumph sc.).

Sheffield and Hallamshire M.C.C.

Recently a large crowd of motorists and others assembled at the Town Hall, Sheffield, at midnight, to see this year's competitors leave on the 316 miles journey to and from Holyhead. Twenty-seven riders started, including five solo, twenty-one sidecars, and one Morgan Runabout. The night was fine but cloudy, and until Chester was reached the journey was made in darkness.

Early breakfast was taken at Northwich at 5.15 a.m., and head lights were no longer necessary. The ride along the sea coast *via* Conway and Bangor was most enjoyable.

The return journey from Holyhead was made in splendid weather, and was much enjoyed. The Anglesea and North Wales coast rides were glorious, and all went well.

At 8 p.m. the first man arrived home, twenty in all completing the course.

The results were as follow:

Passenger Class.—1, A. Blake (10 Morgan), awarded Hutton Shield; 2, G. W. Wilkin (3½ Wilkin); 3, F. Roper (7 Indian).

Solo Class.—1, F. C. Wales (4 Triumph); 2, G. Turner (4 Triumph); 3, D. Kaye (4 Triumph).

The following were awarded bronze medals:

R. Matthews, A. B. Chapman, J. O. Vessey, Kentchner, G. Fletcher, L. Padley, J. Walker, W. L. Angel, F. W. James, J. Beet, R. Stacey, and E. Searle.

O. Stewart won the special prize for the best performance up to 350 c.c.

RELIABILITY WITH LOW COST

THE experience of the designer and the manufacturer of the R. W. SCOUT, Mr. R. Weatherell, in every phase of Motor Cycling, under all and every condition, is beyond doubt very extensive. After experimenting on various types of two-stroke machines for the past 8 years, we are now able to place on the market the most reliable, economical, and most speedy machine ever produced and at a low cost. Severe tests have been made in hill-climbing, etc., and the R. W. SCOUT has proved beyond doubt absolutely perfect in every detail

Price: 60 GUINEAS (Deliveries are from 7 to 14 days)

THE

R.W. Scout.

ABRIDGED SPECIFICATION:

Engine.—Specially designed 3 h.p. Dalm Engine, **Two stroke.**
Frame.—Specially designed for strength and giving comfortable riding position.
Petrol Consumption during tests has proved to be in the region of 120 miles to the gallon, due to special design of the engine.
All Materials used in the construction of this machine are carefully selected, and tested before erecting the machine, and we guarantee a tensile strength of over 15 tons in our Cylinders, Pistons, and Flywheels, workmanship is of the very best, and all parts are interchangeable.

To obtain particulars and specification of the R. W. SCOUT, apply to Dept. B. for Illustrated Leaflet, which will be sent free on application.

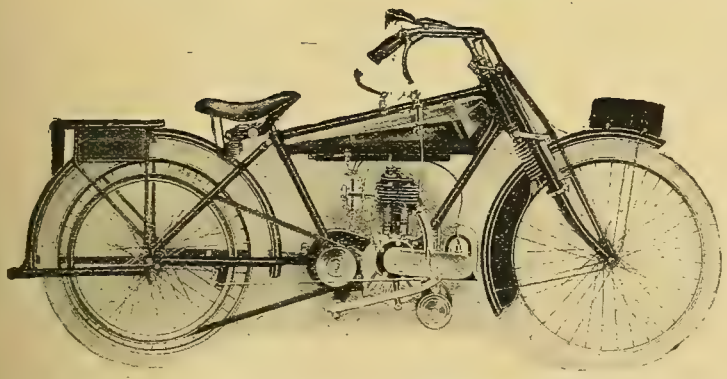
The "CALTHORPE—J.A.P."

$2\frac{3}{4}$ h.p., Two-speed. 71 Guineas, Plus 5 %



We regret that owing to prevailing conditions we were compelled to make a further advance in price of 5 per cent., commencing on June 1st, last.

No motor cycle could be more comfortable to ride than the "CALTHORPE - J.A.P."—mile after mile can be reeled off without fatigue, the rider's position is natural and correct.

Personal comfort and confidence in the machine means everything to the man who would thoroughly enjoy the pleasures which motoring can provide.

Send for the Calthorpe Catalogue for 1920.

W.H.W.

Holdtite

are different to all other Patches

WHY?

They will not stretch in one direction. They automatically lock the Puncture. The Special Woven Fabric incorporated in the Red Rubber enables this action to take place. (Surridges Patent 6866/10).

Ask your Agent to show you the difference.

PRICE **2/6** plus 10%

YOUR AGENT CAN SUPPLY. INSIST ON HOLDTITE.

REFUSE any other Outfit offered.

Carry the Best and avoid bother.

The Holdtite Patch prevents the heat generated by the tyre getting between the patch and tube, thus making a positive repair and no worry.

Send for Full List of Patches, etc.

DEEDS NOT WORDS.

NORFOLK May 20th, 1920.

Dear Sir,

I am thinking of getting another Douglas (I had one from you in early 1919) and would be glad if you will send me full particulars of the 2¾ models I notice in your advertisement in "The Motor Cycle" "Models W. and W.20" at £100 and £105. This is not very enlightening so could you send me photos, catalogues, etc. to illustrate differences between the two models. I SUPPOSE YOUR STATEMENTS AS REGARDS DELIVERY ARE QUITE DEFINITE. IT HAS ALWAYS BEEN A PLEASURE TO DEAL WITH YOUR FIRM SO I SUPPOSE THEY ARE.

Yours truly,
Sd. R.J.

THE MOTOR CYCLE

Insurance Policy

This space will be occupied week by week with copies of actual letters received from Policy holders who have had occasion to make claims. Full names and addresses will be supplied to any bona-fide enquirers.

Gentlemen,

I beg to acknowledge receipt of your favour of the 10th inst., and to express to you my sincere thanks for the very prompt and satisfactory settlement effected by you of the claim against me in respect of recent accident. I shall have much pleasure in recommending your Company to my motor-cycling friends.

Regretting that you should have had to meet a claim on a Policy so recently issued, and again thanking you for your attention,

Yours faithfully,

The only SAFE TEST of insurance is

CLAIMS.

The International Six Days Trial.

THE general lack of support of the International Six Days Trial just completed is a matter for regret. The apathy of the French trade is partly responsible, and no doubt the unfortunate ending of the Paris-Nice event has had some influence upon the withholding of British support. As secretary of the Federation of International Motor Cycle Clubs, the Secretary of the A.C.U. might have done more to exploit the Trial had not the Tourist Trophy Race taken precedence.

When we regret the lack of support on the part of British manufacturers, it is not only the national aspect we have in mind. After all, the A.C.U. Six Days Trial and the Tourist Trophy Race are international events, and they receive very little support from makers outside this country. Our chief concern is that manufacturers have neglected to avail themselves of an opportunity to test their products under conditions impossible to obtain in any other event convenient to our shores, and very few British designers have the slightest conception of the nature of the country in which the Trial has been held. British motor cycles are not intended for British motor cyclists only; they are needed by overseas riders, some of whom live thousands of feet above sea level in hot countries.

The F.I.C.M. has an important duty to perform. It has to encourage international competitions. Friendly contests between the nations are most desirable, and, if properly run, encourage good feeling and a friendly rivalry which cement the good friendship of the past.

It seems desirable that the Manufacturers' Union should meet the Auto-Cycle Union and discuss the matter of these international trials, as the trade seems to have a very hazy idea as to which to support.

The Anglo-Dutch Trial of this week is an excellent example of the successful international contest, in which connection it is of interest to British manufacturers to know that the majority of the Dutch competitors will be mounted on American machines. The performances of the machines of two great exporting nations no doubt will be carefully watched by the motor cyclists of a country which imports most of its motor cycles. This is an aspect affecting all manufacturers who have designs upon Continental and overseas markets.

Sunday Competitions Again.

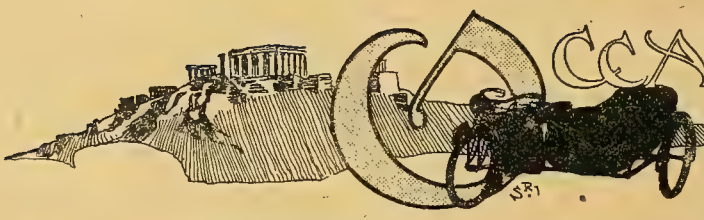
IT has been freely stated by some that the time for reliability trials is past, and that, following the history of cars, motor cycle trials will become gradually fewer in number until they cease to exist, except as sporting club events. On the other hand, trials are actually multiplying in number to such an extent that, not only is every Saturday replete with fixtures, but there is an overflow to Sundays.

The attitude of this journal towards Sunday trials is too well known to need any further explanation, but it is perhaps as well to remind organising secretaries that, though social runs in comparatively small bodies are popular with club members, and do nothing but good if reasonably conducted, the passage of large numbers of motor cyclists, especially through quiet villages, is apt to disturb the peace of the inhabitants, and thus becomes a cause of ill-feeling towards motor cyclists in general.

Numbered machines and riders merely aggravate the case, since they advertise the fact that a certain number of persons propose to enjoy their day's sport regardless of the feelings and susceptibilities of the general public.

We would especially remind motor cyclists, whether competitors or otherwise, of the necessity of riding quietly through villages during Church hours, or at such times as the community are on their way to church, for it is largely due to inconsiderate driving at such times that a certain amount of prejudice still exists in many parts of the country.

An index to the advertisements in this issue will be found on the page facing the back cover.



OCCASIONAL COMMENTS

BY "IXION"

Rustproof Dopes.

MR. BROOKER kindly replies that his anti-rust dope (boiled linseed oil diluted with petrol) is practically irremovable; neither petrol nor benzole will shift it. On the other hand, it is all but invisible. I have also received a sample bottle of stuff bearing the ominous name "Corrosine," which appears to be something of a misnomer; for when I doped a small bolt, specially selected because its coat of nickel was about the poorest I have ever struck, and left the bolt out on the lawn all night, it turned up merry and bright next morning; formerly this plating turned bright orange if I rode through a sea fret. [*Note.*—"Corrosine" is good stuff; made by Thomas Howes, Ltd., Union Works, Smethwick].

About Weight.

I HAVE never met "Kuklos" in the flesh, but I have read him long enough to know that he is no longer a boy, and that he enjoys a push-bicycle as well as a motor cycle. In some recent notes in the *Daily News* he talks about weight. He grew aweary of balancing a couple of hundredweights whilst wheeling it about, and promised himself something lighter for 1920. Procuring catalogues, he found a discreet absence of any notes about weight in the various specifications, with two exceptions, viz., the O.K.-Union (145 lb.) and the Rudge Multi (roadster 214 lb., T.T. model 188 lb.). In denouncing the immense weight of the average modern solo machine, "Kuklos" speaks for a very large public, whose custom the trade will be scheming to obtain as soon as supply has overtaken demand. I am in the mood to endorse his remarks, seeing that recently, in the endeavour to extricate my touring machine from a loose box which it shared with three push-bicycles, I nosedived over the saddle and marked my proboscis severely on the knob of the gear lever, just as the motor and myself crushed the three push-bicycles into a heap of spillikins. It follows that I perused with cold hauteur a letter to hand next morning imploring me to press for a British four-cylinder with shaft drive, four-speed gear, dynamo lighting, and electric starting.

An Unreported Race.

FROM time to time quite illegal and interesting races are organised by local riders, generally as the result of a bet. The hair of the B.M.C.R.C. would doubtless stand on end at the idea of starting a Sunbeam, a Scott, and two ex-W.D. Douglases level *sans* handicap; and the A.C.U. would certainly take punitive measures if it had official cognisance of such an event on the public roads. Nevertheless, such things occur. The prime necessities are to find a safe, straight, piece of road—since the quartet must be started abreast, seeing that Mr. Ebblewhite cannot be engaged for such jobs; and to divert all the local constables by Sinn Fein tactics. Field glasses will show when the road is clear, and if the oddly-assorted machines are all elderly and in private ownership a good finish is quite likely to result. It is a great pity we cannot rig up such events on Brooklands, but the clever man, the shamateur, and the camouflaged trader would ruin them.

On Single Gears.

MODESTY and pathos are equally blended in a letter to hand from an officer who has splashed part of his gratuity on a 1911 Triumph. It is geared 4.2/3.1, carries two heavy suitcases and an A1 fighting man, and will not climb steep hills. Is he a bad driver, or is he asking his mount to do too much? That is the query. Obviously, he is expecting a great deal too much. It is perfectly true that in 1911 or thereabouts experts like Frank Hulbert and the late Ivan Hart-Davies scrambled up all the more famous test hills on sister machines. But their mounts were stripped, and the adjustable pulley was generally screwed pretty well down. In the Six Days Trials of that era most of us ascended various steep hills in heavy marching order; but the routes were carefully planned to dodge anything approaching a freak hill, and our invariable procedure was to take a long cooler at the foot, screw out the pulleys, fit small section belts, change the oil in the crank case, etc., etc. On the top of these precautions some of us failed, and others improved their calf measurement considerably. It is perhaps worth adding that about the year 1911 the trade went rather too far in the direction of high compression ratios, and that a washer under the cylinder of engines of that date sometimes has a marked effect.

A Suggestion for the Six Days.

ONE of my correspondents considers that the A.C.U. hardly proposes to make sufficient use of Brooklands in the Six Days Trial, and suggests that every machine should do five laps for speed marks, and immediately afterwards do a slow climb up the test hill, any conks to disqualify it from receiving any marks in the double test. This sounds suspiciously like our old friend the "C.D.T." in another form. In fact, it is hardly as good as Secretary Loughborough's original notion, which compelled the riders to do both a slow and a fast climb, so that they could not fit abnormal gears. The suggestion is also open to the old objection that it puts too high a premium on skilled driving. On the other hand, the competitions committee might consider part of the idea, to wit, the "conk test." If the machines immediately after the speed test already arranged were sent up the test hill under a speed limit which was just not low enough to call for acrobatic balancing, the climb might show up those engines which distort. I take it this was one of the ideas behind the "C.D.T." in 1919, and it further tested acceleration, which the tests here outlined would not do.

The "Colmore" Trial.

MR. PASKELL'S ferocious suggestions for an ideal reliability trial will arouse keen interest. There is not the least doubt that, in principle, his notion is superior to current events, which depend for their severity on freak hills and freak surfaces, testing the rider more than is strictly fair to the machine. On the other hand, there are obvious flaws in his rough draft. A twenty minutes' margin without penalty in every hour is absurd, unless tyre repairs were in his mind, and these irrelevant stoppages would be better dealt with in another way, *e.g.*, shortening the course to permit of continuous observation, or limiting the entry to sidecar machines. Again, the imposition of an absolute engine non-top needs careful managing. On the one hand, it demands a perfect lubrication system and a well-screened carburetter. But a fouled plug or a bit of dust in the jet is more pardonable matter than a loose mudguard; yet, under the draft, it would apparently entail a heavier penalty. Amateur owners will welcome the trial if it substitutes a really thorough test of the machine for the more usual combination of a medium test for the machine with a searching test of riding skill.

TOURING IN LANCASHIRE.

Even the manufacturing districts of the cotton county have their beauty spots. This is a scene on Rivington Pike, only six miles out of Bolton.

One-gallon Cans.

I DON'T want to ride a subject to death, but the "won't split a can" policy is becoming so common that it is a real nuisance to motor cyclists. I have alluded to it before, and I have no reason to suppose that any association of traders or any petrol distributers have come to an agreement about it. It is easily justified from a vendor's standpoint. The profit on selling a little petrol is not enormous in any case. When the vendor has to detail a boy, spend some time in measuring out the fuel, and, finally, lose money by reason of short measure in the can, he naturally objects to splitting a can; very few of his motor cycling customers have other and more profitable transactions with him. From our point of view, the policy of refusing to split cans is an abominable nuisance. It can only be met in four ways, namely:

(1.) By standardising 2½ gallon tanks.

(2.) By carrying a spare can on the carrier.

(3.) By the petrol companies marketing one-gallon cans in the interests of motor cyclists.

(4.) Bulk fuel storage by garages, with pavement standpipes.

We are quite numerous enough to make our power felt if this nuisance increases. If we show that we will stand no nonsense, the policy will probably die a natural death. Of the four counter measures tabulated above, the big tank or the one-gallon can are both quite feasible. For the moment it is only necessary that the A.C.U. should convince the powers that be that we are not going to be trifled with. Then we can wait and see how matters shape. The secret of the whole business is that, however carefully the petrol companies can their petrol, losses occur by leakage and evaporation.

To quote an extreme instance: My garage now contains a can purchased twelve months ago. It is still sealed, but it doesn't contain much over one gallon, presumably due to evaporation past a perished washer. I do not pretend that the average retailer keeps a can twelve months in stock; it is only by sheer carelessness that I have done so. But a leakage of only a pint per can is serious when it extends to hundreds or thousands of cans per annum.

MOTOR CYCLE CAMPING WITH A LIGHTWEIGHT.

Touring with the Minimum Expense in Accommodation and Travel.

WHEN you have an urgent appointment and 'bus after 'bus comes by with the notice "Full up!" it is annoying, to say the least of it. And when every morning you eagerly open your letters to find the scrawl of various landladies at your old holiday haunts saying "I'm very sorry, but we're full up till October," you begin to get desperate.

Yet the man who has crossed the "donkey's bridge" of cleaning his own engine may be as independent of landladies as he is of railwaymen, as the following will show.

My wife and I intended to have a walking tour in the Lake District, but, as the weather seemed to have broken, we changed our minds at the last minute, and determined to try a motor cycle camping tour down the East Coast. The little machine is a 2¾ h.p. New Imperial Jap, and, to the "general public" it would seem quite impossible to get house and home, bed and bedding, stove and china pantry, to say nothing of change of clothes and priceless sundries, all aboard such a lightweight, still leaving room for the comrade on the carrier. However, it can be done, as the illustration shows.

The Problem of Luggage Accommodation.

With a full load up, we had a stiff proposition in crossing the Pennines, but, starting from Penrith and taking the Appleby-Brough route, we climbed beautifully, chanting praise to the north-westerly wind that urged us onward. Once on the rugged heights of the moorland the world lay at our feet, and the rest was child's play.

Running through Barnard Castle and Darlington, we struck the sea at Redcar, touring south through Saltburn, Sandsend, Whitby, Robin Hood's Bay, Scarborough, Filey, Flamborough, and Bridlington. We stayed where we liked, and as long as we liked—fancy free!

The camping places were quite varied. Sometimes they were on the far stretching moors, by some little stream that ran through the peat and heather; sometimes on some perilous ledge of a cliff with just room enough for pegging out, and the waves breaking on the rocks below. After being forbidden to pitch within sight of the sea these war years, we were a little desperate and took risks. Near Runswick Bay, we pitched on just such a ledge though half a gale was blowing from the north-east. It increased to a gale by 10.30 p.m., catching the little tent and shaking it like a terrier does a rat. It seemed probable that there might be a limit to the staying powers of the light-bamboo poles, delicately shaped to fit into a walking stick! Well—there was! But we had fairly asked for it. The people at Runswick Bay Hotel had not gone to bed, so our luck still held. Next day, at Whitby, we discovered an umbrella maker, master of his craft and with quite a pre-war pleasure in his work, and he quickly mended the broken limb.

That was our only misfortune, and quite worth the fun of it. The machine never required more than a little finger during the whole tour. It *did* require that, for the spring holding the contact-breaker rocker must have got a bit of sand underneath, for it worked off and consequently caused misfiring.

One night we camped in a depression in the moor that completely screened us from the road. After packing, I started the engine and commenced to ride up the rabbit track that led out of it, when suddenly, over a gorse bush, I saw the most astonished tourist's face I have ever seen. Whether the man thought I came out of the earth or had ridden cross-country over the moors from Scarborough, I could not say!

The greater part of our time was spent at a camp above a stony beach, where the white cliffs that ran out to Flamborough Head start up from Filey Bay. We were disappointed to find we had just missed the famous egg-collecting along Bempton cliffs, the season having closed the previous day. Thousands upon thousands of the guillemots were perched on the chalky ledges, with here and there the brilliant red beak and feet of the sea parrot.

Open Scenes on Moor and Coast.

The homeward journey was made inland to the main York and Darlington road, *via* Sherburn, Pickering, and Helmsley. The road from Helmsley through Ampleforth to avoid Sutton Bank was simply appalling—deep ruts filled with water and the rest slime.

Practical readers will want some idea of the weight which it is necessary to carry for a trip of this kind. Much, of course, depends upon character, and the rest on sense. The man who cannot travel without a trouser-stretcher had better give it up. The only

Motor Cycle Camping with a Lightweight.—

way is to get all you think you will need on the table and start weighing it with the kitchen scales seriatim. When brought down to the irreducible minimum, sleep on it, and next day go through the same process with what is left. After the trip, you will find that a third of the things have never been used, and the one thing essential to comfort was left at home. It is the same story as to what spares to carry for the machine. We have all been through that! The following weights of my own outfit will be, at any rate, a guide, though I may as well confess that my first camp required two heavy boxes! Here, then, are my weights at present, which will seem ridiculously light to some and unnecessarily heavy to others:

Tent 2 lb.
Aluminium pegs 2 oz.
Rubber ground sheet 12 oz.
Ground blanket 1 lb.
Eiderdown sleeping bag 4 lb.
Baby Primus stove 1 lb. 8 oz. (a pocket Primus would be better).

Camping on the lonely moors of Yorkshire.

Paraffin for the Primus I carried in my auxiliary tank. The sleeping bag was rolled up in the ground sheet and carried in a hold-all on the handle-bars. The rest went into a brown canvas motor cycle pannier that fell on either side of the carrier As the weather was very cold and wet, we also slung on a knapsack. A white canvas shoulder satchel was useful for provisions. The poles were fitted within one another in the final form of a walking stick and strapped along the tank. A part of an old ground sheet served to cover the machine when camping in the open away from houses. If near a farm, they will supply milk, butter, and eggs, and find cover for the motor cycle. The concern for one's welfare is most amusing.

It is to Mr. T. H. Holding, who was the founder of the C.T.C., that I am indebted for the light equipment, in which he has specialised. He still carries on at 7, Maddox St., W. My only bond is that of gratitude for many a good holiday at home and abroad.

For lovers of the wild, this is an ideal way of spending a holiday. Many a glorious bay and moorland stream lies unknown to the company promoters. And to many with limited purse and sporting taste, there is the value of its cheapness. One pound will go as far as five in real pleasure and fresh and vivid memory.

To keep the sport on a decent footing, it is necessary to remember that the true camper will never leave a trace of his sojourn save the blackened ring of his camp fire.

F. CHENHALLS WILLIAMS.

THE PICNIC: NOT THE LEAST ENJOYABLE FEATURE OF THE WEEK-END RUN.

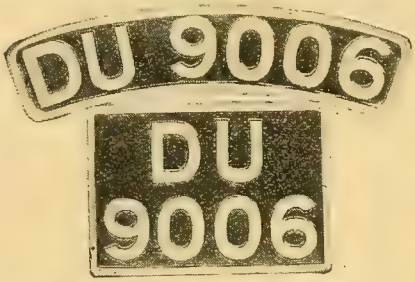
No family sidecar is complete without a picnic basket, which provides one of the greatest pleasures of summer time rides in the country.

NEW ACCESSORIES.

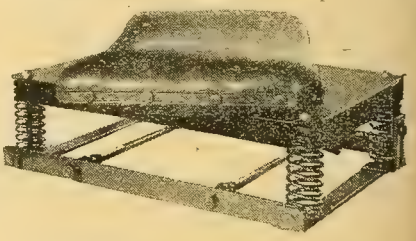
IT is well known that every purchaser of a motor cycle is a potential buyer of accessories; hence the number of new articles which are introduced every week. The selection illustrated this week is of quite a useful character; in fact, most fitments now introduced are of a more serious nature than those which were sold before the war. They are the outcome of experience on the part of riders who have found a need for something to meet their requirements and are usually produced for the market on the assumption that the need for an article experienced by one man has been experienced by others.

Very rare is it that a would-be manufacturer of accessories thinks out what he shall make in order to enter the market—rather is it a question of what he shall make first.

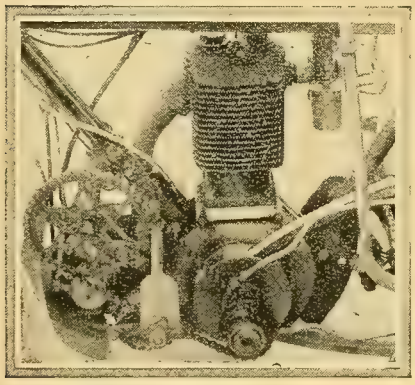
The Apax plug cleaner, made by the Aircraft Improvements Co., 10, Coleman Street, E.C.2. The device consists of an aluminium case which contains a number of fine steel wires, which clean the plug points when the case is shaken.



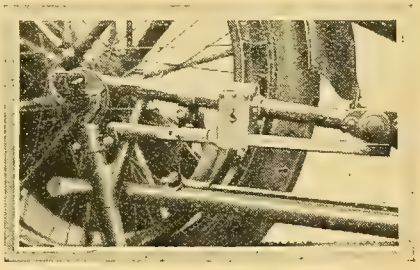
Cast aluminium number plates, a speciality of the Atlas Engineering Co., Hill St., Coventry.



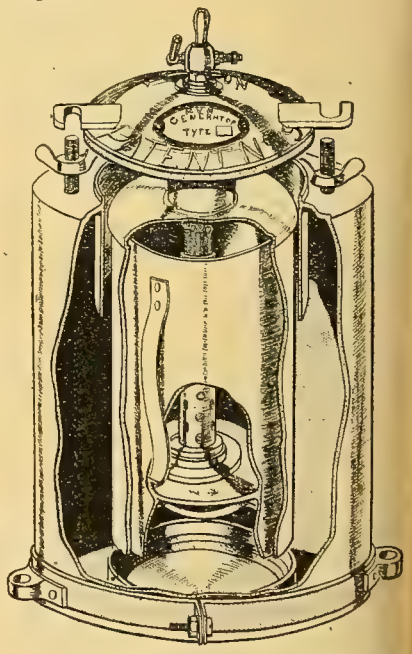
Briswing pillion seat, made by C. Bryant, Bridge Street, St. Ives, Huntingdonshire. The upholstered seat is mounted centrally, and may be moved round to any desired angle



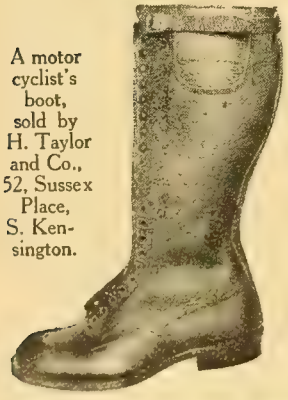
A starter for Zenith motor cycles manufactured by A. and E. Lower, Seven Sisters Road, S. Tottenham



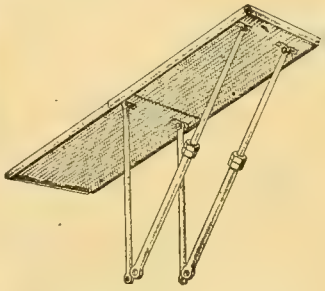
The "Leavesafe" motor cycle lock, made by H. Sinclair, 5, Crescnet Grove, Clapham, S.W.



A wick-feed generator manufactured by the A.V.A. Generator Co., 75, East Road, Stratford, E.15. The motor cycle size takes ½lb. of carbide, and provides five hours lighting with a ⅜ cubic feet head lamp and a ⅛ c.f. rear lamp The price is £2



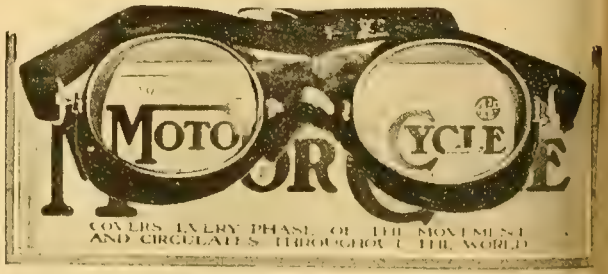
A motor cyclist's boot, sold by H. Taylor and Co., 52, Sussex Place, S. Kensington.



An extensible carrier, patented by Mr E Seed, 8, St. Osburg's Road Coventry.

Motor cyclists' "S.O.S.," marketed by the North End Garage, Full Street, Derby.

The Democrat spirit stove, with saucepan, burner, spirit, and holder. It can be packed away in a box 4½ × 4½ × 4in. It is made by Marris's, Ltd., Cumberland Street, Birmingham



For motor cyclists who wear glasses. Goggles fitted with lenses a speciality of F. Wilson, 28, Church Road, Upper Norwood, London, S.E.

IDEAS: Useful and Ingenious.

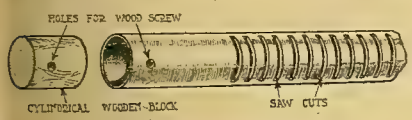
Removing Water from Petrol.

QUESTIONS asking advice on how to remove water from the tank are of recurring frequency; therefore the following method, which I invariably use, may be of service. Obtain a medical syringe of any description, and add sufficient rubber tubing to the business end of it to reach the bottom of the tank. Lift the front wheel slightly, thus allowing the water to collect where it can be seen from the filler cap hole. Place the rubber tube over the bead of water, and withdraw the plunger sufficiently to suck the water into the tube. A tank can be cleared in a few minutes with a minimum loss of petrol.—G.T.

Method of removing water from tank.

A Silencing Tip.

A TIP for silencing the engine is clearly shown in the drawing, and can, of course, be applied to almost any machine. It is very effective, and does not appear to cause back pressure.

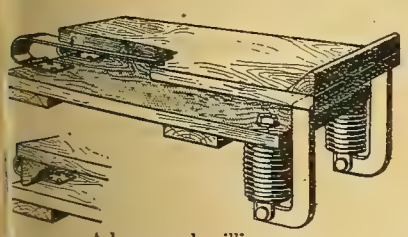


A simple silencing arrangement.

For competitions the plug can be removed in a few seconds, and absolute freedom of exit thus reinstated.—H.M.B.

An Inexpensive Pillion Seat.

TO those motor cyclists who desire to make a neat and comfortable pillion seat without going to any great expense, the design illustrated on this

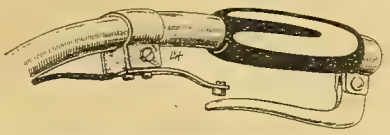


A home-made pillion seat.

age and costing well under ten shillings, ould be of interest. It consists of two eces of 1in. board hinged at the front ordinary gate hinges curved over, as own, and sprung at the back by two ddle springs carried on a simple acket. The lower board is, of course, ed rigidly to the carrier.—C.H.

A Magneto Cut-out.

AN easily-made magneto switch, which is actuated by the exhaust lifter lever, is shown in the accompanying illustration. Most exhaust controls have sufficient "play" to allow a certain

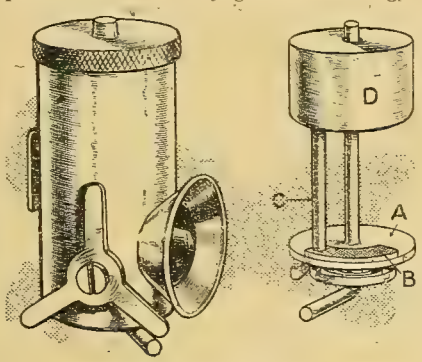


Combined valve lifter and magneto switch.

amount of movement of the lever before the valve is actually raised off its seat; this movement is utilised to "earth" the low-tension current by adjusting the metal strip close to the tip of the inverted lever.—E.G.

A "Mechanical" Rear Light.

A CORRESPONDENT has recently protected a rear lighting device which is a compromise between the ordinary lamp and the red reflector. It consists of a cylindrical metal body provided with a ruby glass, containing a



A mechanical tail lamp which emits a series of flashes in place of a light.

simple form of mechanism operated by the spokes of the rear wheel, whereby a series of sparks are made by friction between a partially rotable disc A on which is mounted a file B and a flint rod C, which is kept in contact with the file by reason of the weight D.

Rear Lamp Attachment.

THE law requires that the rear light of any motor vehicle shall be on the off side, with the result that in the case of motor cycles it is invariably fixed to the rear carrier or number plate. In this position it is subject to excessive vibration and jolting—unless the carrier is well sprung—which is the main cause of lamp failures.

Sidecar attachment for rear lamps.

In the case of sidecar outfits the sprung body of the sidecar would undoubtedly be the best position for fixing the lamp if one did not run the risk of the police taking exception; a reader, however, has overcome this difficulty by an arrangement which he has protected and which is illustrated herewith.

It will be seen that a neat bracket is mounted on the sidecar body and forms a clamp for a long rod to the end of which is fixed the tail lamp, allowing the latter to overhang the motor cycle carrier, thus complying with the law. When not in use the lamp can be pushed up close to the sidecar body.—B.E.

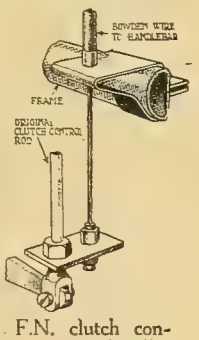
Fixing a Gudgeon Pin.

IT often happens when a cylinder is sent to be rebored and a new piston fitted that no provision is made in the latter for securing the gudgeon pin. This presents no difficulty in the case of an ordinary piston where copper buttons can be used, but in the case of a deeply waisted design the problem of retaining the gudgeon pin in position is more difficult. A method which has proved satisfactory is the use of a length of brass rod which fits the hollow gudgeon pin nicely and protrudes about ¾in. at each end. The ends are split with a fine saw and made soft, so that when the piston and gudgeon pin are assembled, the ends can be turned down as shown, thus preventing the gudgeon pin working out.—C.M.

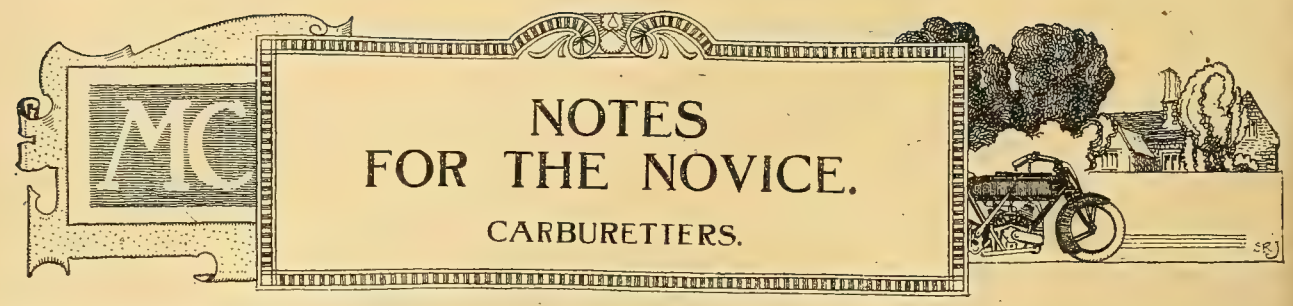
A simple method of fixing the gudgeon pin.

Handle-bar Controlled Clutch on F.N.

OWNERS of 2¼ h.p. two-speed F.N. motor cycles, who probably find the present position of the clutch lever does not allow of easy manipulation in traffic, will be interested in an easy method of making the clutch controllable from the handle-bar by ordinary Bowden mechanism, without interfering with the combined clutch and gear control in any way. As will be seen from the illustration, a suitable clip is fitted to the bottom frame member and supports the cable sheath, while the end of the cable is conveniently fixed to the bottom of the clutch operating rod.—R.C.W.



F.N. clutch converted to handle-bar control.



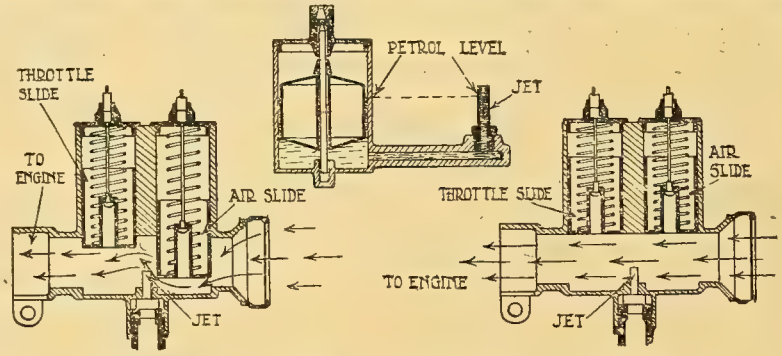
NOTES FOR THE NOVICE.

CARBURETTERS.

IT is almost impossible to exaggerate the importance of correct carburation; therefore, the vital part which the carburetter plays on a modern motor cycle can easily be realised. The carburetters at present in use are mainly of three kinds: automatic, semi-automatic, and hand-controlled.

The first-named has but one lever, and, by means of its internal construction, it aims at giving a perfect mixture at all speeds and throttle openings—that is to say, the single lever controls both the supply of gas to the engine and the supply of air to the carburetter, so far as may be, at the same time. There are, however, many difficulties to be overcome in attaining this object, and some of these will be touched upon later.

The semi-automatic carburetter has two levers, but for general use only one of them is required after a start has been made. The air lever is closed, or nearly closed, for starting purposes when the engine is cold; it is then fully opened, and so left for all ordinary speeds. In some carburetters it is desirable to close the air lever slightly when the throttle is opened wide for hill-climbing purposes, and also for town riding and bad corners. This is because the throttle barrel also controls the admission of air to some extent, though not so completely as in the case of the automatic carburetter, and for the particular circumstances just mentioned the air is sometimes in excess of what is required. Very often in the semi-automatic type of carburetter the jet orifice is enlarged as the throttle opens. This is done by means of a taper needle, which is attached to the throttle barrel, and projects into the jet. Then, again, some jets are varied by means of a similar needle operated by a screw above or below them.



What happens in the carburetter. (Left) When the throttle is open and the air lever is closed a heavy suction is concentrated on the jet. (Right) The air slide open.

Sensitive Air Adjustments.

What I have termed the hand-controlled carburetter differs from the semi-automatic, in that it is much more sensitive to the position of the air lever. This cannot be fully opened for the greater part of the running, but must be constantly manipulated as the speed or throttle opening may require, and consequently much more skill and experience are needed to obtain satisfactory results from carburetters of this type, but when skilfully used they give excellent consumption—perhaps better than any other type—ample speed, and good pulling power for hill-climbing. It is, however, much easier to upset the mixture and so stop the engine at a critical moment when a sensitive carburetter is in use.

Semi-automatic Carburetters.

The latest Senspray carburetter has a device which can be set in three different positions to render the carburetter automatic, semi-automatic, or sensitive, the last named giving the best consumption, and the first being simplest to use. The two-lever Amac, B. and B., B.S.A., and Triumph carburetters are excellent examples of the semi-automatic type. The B. and B. Universal with adjustable jet is an example of the hand-controlled type, and gave very good results in skilled hands, so long as it was not allowed to flood, when it became most erratic. The Claudel-Hobson, single lever Amac, and several American carburetters may be mentioned as automatic carburetters, which leave but little to be desired, and the Eta is a design which seems to promise great things, for it is constructed on the principle of scientific calculation, but I have not yet had any personal experience of it. The R.C.F. is another carburetter controlled by one lever only. This has three jets, which when the throttle is closed are entirely outside the spraying chamber, but as the throttle opens they are in turn subjected to a rush of air, which draws petrol from them and carries it into the carburetter, and so to the engine. This carburetter is economical, and can be tuned to give high speed and power.

I do not for a moment suggest that the carburetters just mentioned by any means exhaust the list of efficient instruments of the various classes, for there are many more which could be added. I have, however, referred principally to those with which I am personally familiar, and these include the majority of the most popular instruments of to-day, as a glance over any large assembly of machines will show.

Notes for the Novice.—

The simplest form of carburetter is a jet placed in a pipe (the racing Binks is an example of this); but such a carburetter being designed expressly for racing will be satisfactory only at certain speeds, where only the highest possible revs. are desired, but not for general purposes. There is a touring model Binks for the latter service.

The Construction of a Carburetter.

Unfortunately the problem of making a satisfactory automatic carburetter is much more involved than this. It is necessary to construct an instrument which will in the first place give a perfect mixture at all throttle openings, and in the second place give a perfect mixture at all speeds. In addition to these desiderata, some adjustments for temperature which requires only occasional settings and for a change of fuel are necessary. It is possible that the same adjustment might be employed for both these purposes, though it is probably better to control for temperature and atmospheric conditions on the air as in the latest Everest or Claudel-Hobson, and for a change of fuel by means of a variable jet. If the adjustment necessitates taking the carburetter down and wasting the fuel it contains it is likely to be neglected. Adjustable jets are generally controlled by needles, and I strongly advise that the taper of the needle be not too blunt, in which case a small movement of the needle makes a considerable difference to the petrol orifice, and consequently the correct setting may be very easily lost and not so easily recovered. It should always be possible to go back to the original setting with exactness. The W.S.R. adjustable jet is a very useful fitment, but I should prefer a finer taper to the needle.

J.H.W.

Flat Twins and Sparking Plugs.

The Question of Over-oiling and Overheating. Some Peculiar Experiences.

I AM inclined to think that nearly all the trouble experienced with present-day flat twins has its root in faulty oiling systems. Years ago, with a water-cooled Scott, I experienced plug troubles identical to those that harass flat twin experimentalists to-day, and those troubles certainly were not due to overheating, since the plugs screwed into the water jacket. Nor were they due to excessive revs, for they occurred when progressing moderately on a 3 to 1 gear.

I am not overlooking the fact that it is the central electrode which overheats, and that therefore the temperature of the plug base does not play a very important part; nor am I forgetting that, even with my 3 to 1 gear, the plug points of the two-stroke were subjected to as much heat as they would be on a four-stroke geared 6 to 1; I am merely relying on the fact that we purposely used plugs the points of which were calculated to become incandescent, for only by this means could we ensure against the troubles accruing from an imperfect system of lubrication. What I mean is that the overheating does not matter much so long as the lubricating system be perfect.

Scott Experiences.

One or two experiences go to back that belief. What is it? In the first place, we had two recognised ways of abolishing for ever all suggestions of plug trouble with the Scott engine. The first was to cease oiling it—or rather to cut the oil supply down to the merest sniff, and use the best oil procurable. Owing to the roller big ends and the water cooling no damage ensued. Having reached a very satisfactory point of economy, we were able to use almost any type of plug that would fit the cylinder, whereas previously we were confined practically to one make of the platinum wire point variety, which burnt itself clean of oil.

Another way to remove one's plug troubles was to scrap the original Scott automatic oiling system, whereby the cylinder with the better compression got the lion's share of lubricant, and employ a double drip feed which gave both cylinders a like amount.

Yet one more experience that goes to support the theory set forth concerns a certain little hot-stuff car of world-wide reputation, though a certain shadow of doubt may exist as to its exact nationality. During a long night journey engine troubles developed, and were finally traced to the sparking plugs, whereupon we stopped at a garage for renewals. Here the only plugs we could obtain were the very cheapest productions of the States. They had long crooked wire points which projected well into the cylinder. However, we bought four at about a shilling each, equipped ourselves with adapters to suit, and sallied forth into the night.

Hey presto! Never before had the engine pulled as it pulled during the remaining six leagues home. There was positively no holding it, and the trip evolved itself into a glorious blind, so that we turned in feeling that we had made something by way of a discovery.

Next morning, however, the engine refused to start, and examination showed that the plug points had absolutely fused away, and were hanging in little globules, thus affording sparking gaps of about ¼in.

Lubrication and Compression Ratio.

By the foregoing I do not wish to infer that incandescent plug points are a feature to be encouraged. Overheating of the points is undesirable, but is not so common a cause of plug trouble as imperfect lubrication. Given a high compression high speed engine, plug troubles are to be expected, first because much more strain is thrown upon the plugs, secondly because they are exposed to greater heat, and thirdly because the heat and the high compression together are the ideal conditions for pre-ignition of the charge. If imperfect lubrication is added we apply an irritant to an already sore point, and the band begins to play. Moreover, if the lubricating system is bad we are compelled to use plugs that are apt to cause pre-ignition, for if cool running plugs are used one can never get anywhere owing to oiling up.

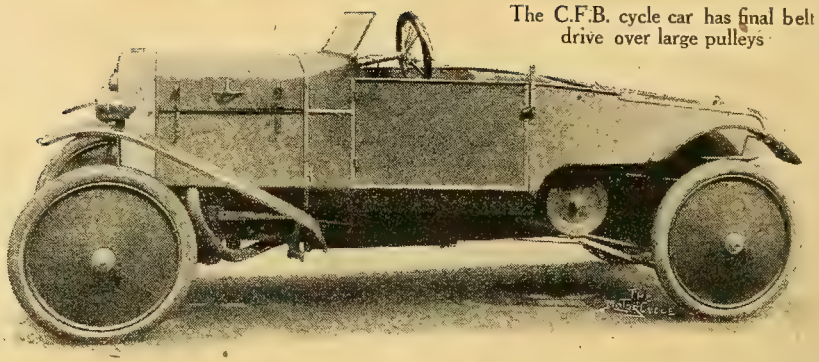
Therefore the first step to be taken in removing our plug troubles is to perfect our oiling system, and in this the flat twin presents difficulties. One is inclined to think that splash feed will never prove wholly satisfactory for this type of engine.

CHINOOK.

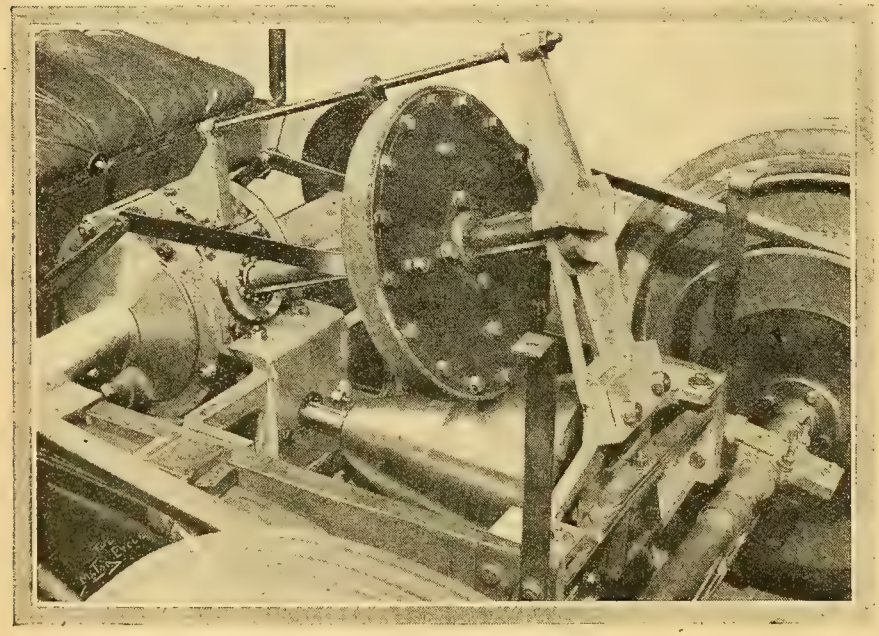
TWO NEW CYCLE CARS.

Friction Transmission and Air-cooled V Twin Engines favoured by Makers of Light Four-wheelers.

TWO new cycle cars have recently been introduced to the British market for those who desire the protection afforded by a car at a price approximating to that of a motor cycle and sidecar. The first of these has many novel features including a friction transmission which utilises a cone in place of the more usual disc. This is the C.F.B. cycle car manufactured by the C.F.B. Car Syndicate, Ltd., 51, Church Road, Upper Norwood, S.E.19.



The C.F.B. cycle car has final belt drive over large pulleys



Novel friction transmission system on the C.F.B. cycle car.

The friction unit is located at the rear of the chassis and is driven by a long propeller-shaft provided, at either extremity, with a Hardy pattern steel plate universal joint. The length of and the consequent whip in the shaft necessitates an additional bearing which is housed in the centre cross member. As may be seen from the illustration, the friction disc is mounted on a splined shaft rotating in ball bearings held, at the rear, in an aluminium bracket and, at the front, in the bevel box casting.

A very ingenious drive is incorporated in the box whereby an indefinite number of gear ratios can be obtained, both forward and reverse, controllable from a lever in a recess in the back cushion. A small constant mesh bevel pinion is fixed to the end of the splined shaft and engages with two crown wheels mounted on a countershaft to which 10in. diameter belt pulleys are attached. These crown wheels are free to rotate on the shaft until engaged by a central sliding dog which, meshing with a corresponding dog on one or the other crown wheel, provides forward and reverse speeds respectively. The gear change is effected from a centrally disposed gear lever, whilst the disc is raised from the cone by two cranked levers connected to the "clutch" pedal. Contact with the cone is enforced by a laminated spring laterally located at the rear of the chassis.

The engine fitted is an 8 h.p. Novelette—a French-made V twin specially designed for cycle car work. It may be remembered that this power unit has been previously described in *The Motor Cycle*. It is provided with two fans mounted in the front of the cylinders; it has a bore and stroke of 85 mm. and 95 mm. respectively.

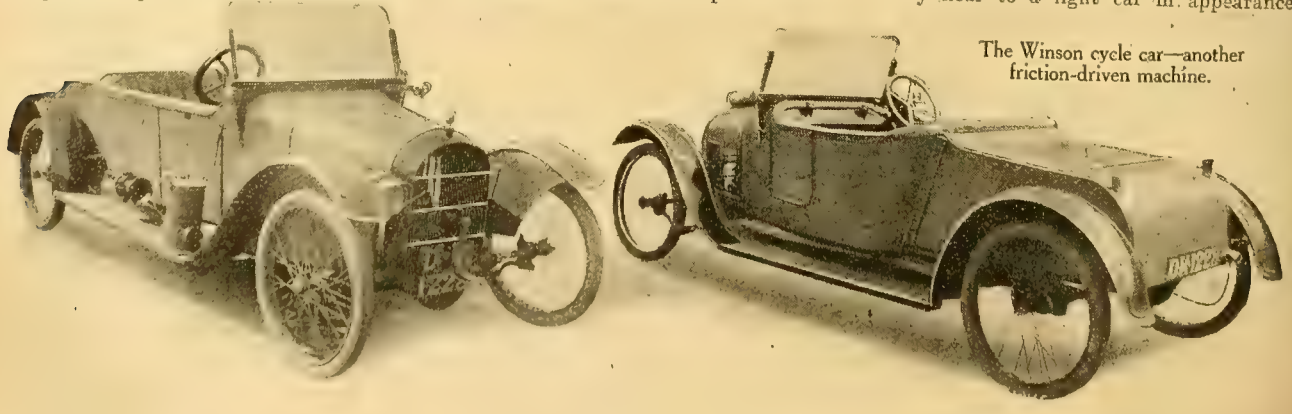
Adequate seating accommodation is provided for two persons, and the full cantilever front and rear springs provide an extremely comfortable vehicle.

The Winson Cycle Car.

The second vehicle illustrated is the production of J. Winn, of 86, Reform Street, Rochdale, who for some time has been known in connection with all-metal sidecars and motor bodywork generally.

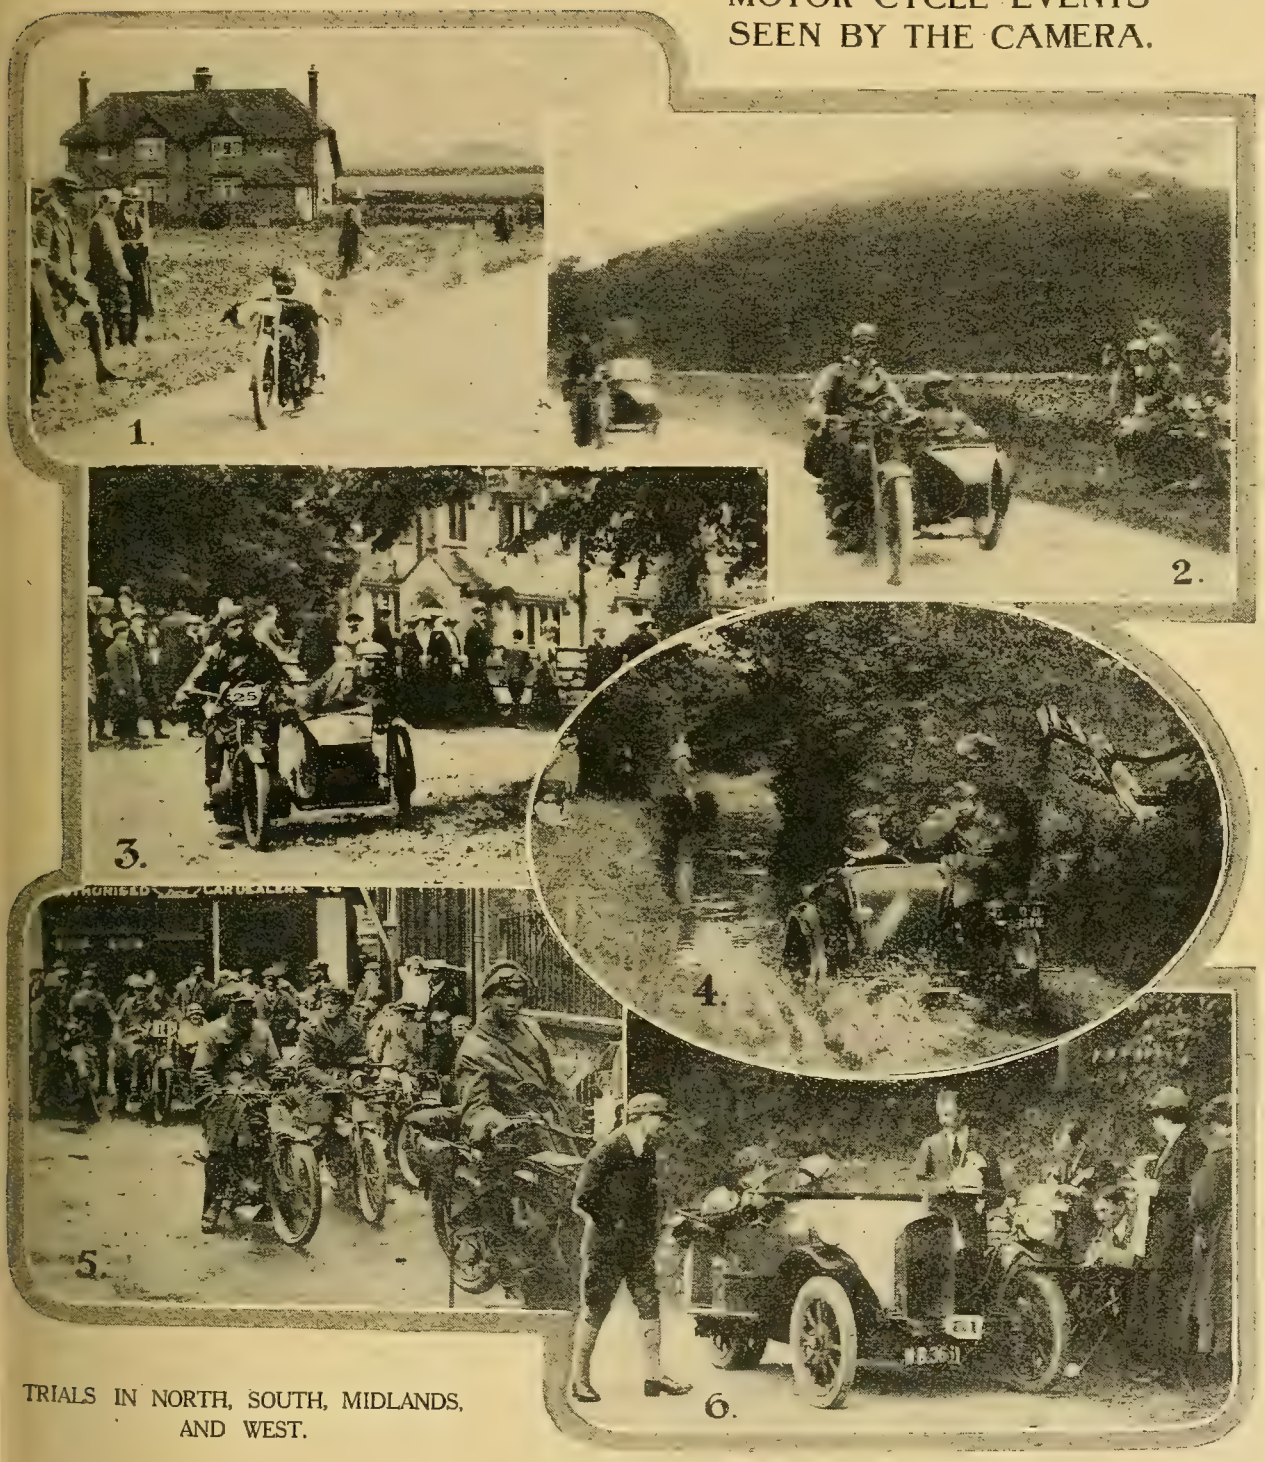
It has a more or less conventional specification, embodying an air-cooled Precision or Blackburne engine, friction transmission and final drive by silent chain to live back axle. The steering is by chain and cable, and the suspension by coil springs.

Having a wheelbase of 8ft. 6in. and a track of 3ft. 10in., the vehicle comes very near to a light car in appearance.



The Winson cycle car—another friction-driven machine.

MOTOR CYCLE EVENTS SEEN BY THE CAMERA.



TRIALS IN NORTH, SOUTH, MIDLANDS, AND WEST.

(1) A lightweight at speed. E. B. Ware (2¾ Matchless-Jap) crossing the starting line at Luton Hoo. (2) Two Harley-Davidson riders in the Sheffield and Hallamshire run to Holyhead and back. (3) C. Scowcroft (8 Enfield sc.) on a hairpin bend at Whitewell in the first North-western Centre (A.C.U.) inter-club trial. (4) Some watersplash! Fifty yards of deep water being traversed by a Triumph sidecar in a Coventry and Warwickshire M.C.C. event. (5) At Chepstow, where the Worcester M.C.C. met the competitors in the recent Birmingham M.C.C. lightweight trial. (6) Merrall Brown on his 10 h.p. three-wheeler checking in at Whitewell in the North-western (A.C.U.) inter-team trial.

AN UNTAPPED MARKET.

A plea for a popular-priced motor cycle of about 4 h.p. Views as to the best design to reduce costs to permit the production of a low-priced machine.

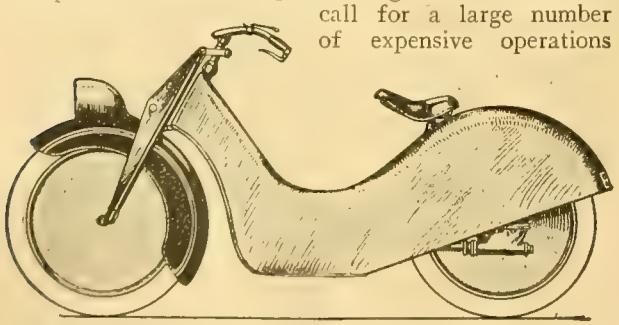
IN these days of soaring prices, it seems hopelessly out of place to even visualise a 4 h.p. motor cycle selling at such a figure as to be within the reach of that enormous section of the public which every week scans with longing eyes the "For Sale" columns of *The Motor Cycle*, and, after a careful search for a moderate priced mount, reluctantly gives up the idea of becoming an owner. There is an ever-increasing number of prospective motor cyclists who are unable to afford, say, £100 for a 3½ or 4 h.p. machine, and who, on the other hand, will not consider a more moderately priced scooter or small two-stroke as an alternative. The manufacturer who catered for this class would be assured of such an output as to make it a commercial proposition to undertake the necessary heavy outlay necessitated by organising for mass production.

The motor cycle is now quite recognised as a sound, reliable, and pleasant means of travel, and is becoming more popular every day among those who have the means to purchase machines. There is thus every excuse for adopting an optimistic outlook as to the future of the industry.

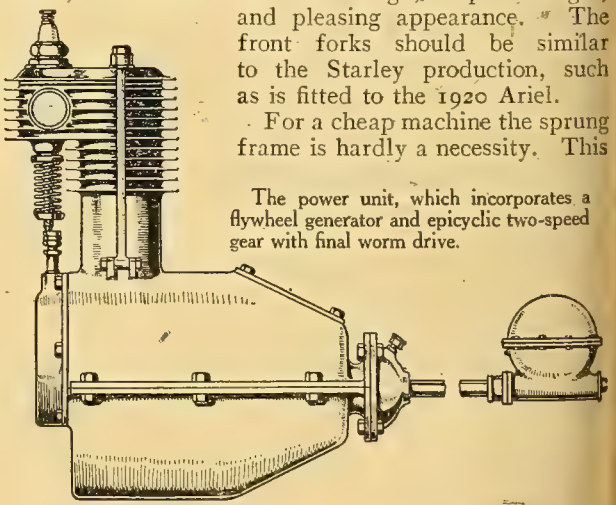
The figures given on this page are of considerable educational value to manufacturers, and the 1928 total is entirely governed by the attitude they adopt in the next two or three years. While admitting that the cost of raw materials is very high, the writer contends that cost of labour is the predominating feature in the prime cost of the motor cycle of to-day, and therefore a machine designed with a view to reducing the number of manufacturing operations and quantity of components could be sold at a figure far below that asked at the present time. It is the aim of this article to endeavour to describe a machine which would lend itself to the necessary curtailment of expenditure of labour.

Expensive Tubular Frames.

The modern diamond frame consists of a miscellaneous collection of expensive lugs and tubes which call for a large number of expensive operations before they can be built up into a complete frame, added to which bad workmanship or material in any one of these components may easily cause a failure of the whole structure. The major portion of the labour called for in a frame of tubular construction could be eliminated by the adoption of the pressed steel type, which also can be so designed as to form petrol and oil tanks, tool box, etc., thus further cutting down the cost of production. The makers of the Beardmore-Precision are to be congratulated upon their departure from the strictly conventional, and are undoubtedly progressing in the right direction. A pressed steel frame, following those produced by the Pullin and D.F.M. Co., which totally enclose the power unit and at the same time present a wonderfully clean exterior, is, in the opinion of the writer, the ideal frame. The initial cost of the dies necessary for producing this form of frame is admittedly high, but the demand for a popular-priced motor cycle of this type would more than justify the outlay. The modern wheels, which usually consist of a huge number of small parts, such as nipples, spokes, and washers, could be replaced by pressed steel wheels, such as the new Sankey disc wheel, which is of excellent design, ample strength, and pleasing appearance. The front forks should be similar to the Starley production, such as is fitted to the 1920 Ariel.



A totally unconventional design of pleasing appearance, which may be hosed down without ill-effects.

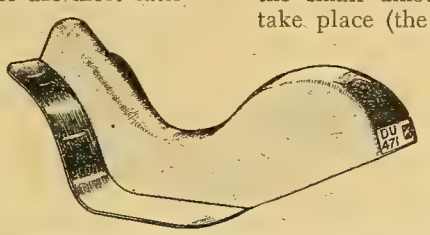


The power unit, which incorporates a flywheel generator and epicyclic two-speed gear with final worm drive.

For a cheap machine the sprung frame is hardly a necessity. This statement will no doubt raise a "hornet's nest" around the writer's head, but the fact remains that for years riders have been quite content to use rigid frames, and even to-day the majority of motor cyclists are bestriding the simpler type. Provided the tyres are on the large side, 28in. wheels are fitted, and the wheelbase is fairly long, the road shocks are not excessive. Without a doubt spring frames are delightful, but it is far better actually to own an unsprung 'bus one can afford than merely long for a more expensive and luxurious mount.

An Untapped Market.—

It is essential, for an engine which is to be inexpensive, that the design be as simple as possible and the number of parts minimised. It should be capable of retaining its pristine "tune" for long periods without attention, and should therefore not be of the ultra-efficient, small capacity type. An engine on the following lines would appear to be suitable for the machine in view: A fairly low compression unit of about 600 c.c., with detachable head and *really large* plain bearings throughout. The latter are most satisfactory *if the area is sufficient* (hence the italics). They also have the advantage of being much quieter than ball or roller bearings. The unit should include a flywheel generator (for ignition and lighting), and a two-speed epicyclic gear after the Ford pattern—the whole to be mounted across the frame in the same manner as the lightweight F.N. The cylinder barrel, top half of the crank case, flywheel, and gear casing should be cast integral, and the corresponding bottom half pressed from sheet steel.



Combined leg shields and footboards, ensuring cleanliness of the rider

Lubrication.

The oiling system of a plain bearing is most important, and to obtain the best results, true forced lubrication (as opposed to mechanical lubrication) should be used. This, however, entails considerable manufacturing expense, which, in the present instance, is undesirable; therefore, a system of modified splash lubrication on the following lines could advantageously be adopted. An ordinary meshed gear wheel pump, fitted in the sump and discharging into a trough of generous dimensions into which the big end scoop dipped, would give excellent results provided the various oilways were correctly cut and disposed. The walls of the cylinder could be adequately oiled by means of holes drilled in the walls of the piston, and a scraper ring might be fitted to the latter.

The Sankey disc wheel, which is dished, so that the hub and rim centre lines coincide

Transmission.

After many years of trouble with the accepted forms of drive, the writer is astonished that the claims of the shaft drive have not received more consideration. In the case of the suggested machine at present under discussion, the fact that the engine is set across the frame immediately fits it for this system. An inexpensive shock absorber, such as is fitted to many of our sidecar machines, could be fitted; this could also be made to act as a universal joint to compensate for the small amount of deviation in line which might take place (the frame being unsprung).

Controls, Accessories, and Finish.

Twist grip controls and single-lever carburetter, which relieve one of the necessity of continuous "tap twiddling" and of removing one's hands from the bars, should be incorporated, while the gears could be foot-controlled. Electric lamps and horn should be supplied from the flywheel generator, the lamps so constructed as to present a clean exterior with no dirt-accumulating propensities. The whole machine must be rustproof-treated, in the same efficient manner as the Lea-Francis, so that hosing down after a dirty run would have no ill-effects.

Possible or Otherwise?

It is well known that a certain American car was produced at a ridiculously low figure before the war, yet the company responsible for its production is by no means in danger of becoming bankrupt. The contention of the writer is that it *is* possible to design a motor cycle which can be sold at a low figure if produced in sufficient quantities. British manufacturers to-day have more orders than they can cope with, but this will not be the case when the present demand for high-priced machines is satisfied. The firm, or combination of firms, which tackles the problem of producing a cheap machine will reap its reward. REKOL.

NEAR DALNACARDOCH. To tour the Highlands is the ambition of every keen motor cyclist. Once he has been he never forgets the experience, for it is brought home to him with force that there is no need for Britishers to go out of their own country for fine scenery.

WHY NOT A MONOCARETTE ?

A Miniature Four-wheeler of the Simplest Possible Type.

JOHN CITIZEN has always wanted a little vehicle for running about—one which he can step into and go to the office without need of donning overalls.

The requirements for a machine to meet this demand are not out of reason, and should include (1) speed up to, say, 35 m.p.h., (2) hill-climbing ability for main road hills, (3) a single-seated body with provision for carrying an extra passenger when required, and (4) any unit which will give the necessary power with a minimum attention and at a moderate cost.

The writer, like many other enthusiastic amateur cycle car builders, has worked out plans for the "ideal machine," but, unlike others, has concentrated on a monocar with the lowest possible horse-power. The following is a brief description of this machine :

ENGINE.—Air-cooled, 69×73 mm., 273 c.c., 2½ h.p., single-cylinder overhead valves.

FRAME.—Either wood reinforced with steel flitch plates or steel tubular.

WHEELS.—Detachable 24×2in. wire wheels

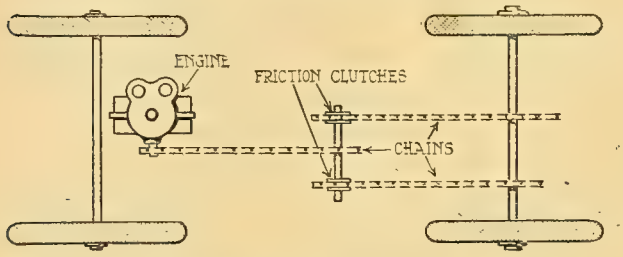


Fig. 1.—A simple two-speed friction clutch transmission

AXLES.—Straight tubular.

STEERING.—Central pivot wire and bobbin steering, operated by wheel.

SUSPENSION.—Single coil front spring, double coil or quarter-elliptic rear springs.

WHEELBASE.—About 5ft.

TRACK.—2ft. to 2ft. 6in.

BODY.—Built with wire, wood framing, and canvas.

In this brief description it will be seen that any mention of type of transmission employed or position of engine has been studiously avoided, the reason being that the choice of transmission is so wide. The following types of transmission and engine positions, however, will be found suitable for this machine :

(1.) From an engine situated in front, a chain drives a countershaft on which are two friction clutches, thence by two chain wheels carrying chains to the back axle, thereby giving a two-speed clutch gear.

(2.) Drive first taken through gear box and clutch, attached to engine situated at rear, thence by single chain to back axle.

(3.) The engine, which is over the back axle, drives a friction disc mounted on a countershaft. A chain from the latter drives the back axle.

If the engine is placed at the rear, particular care must be taken with the cooling arrangements. If, however, the top of the engine is totally enclosed except for air shutters at the rear, by a large removable cover and a big air scoop attached under the car so that a constant blast of cool air is directed on to the cylinder, the cooling should be efficiently performed.

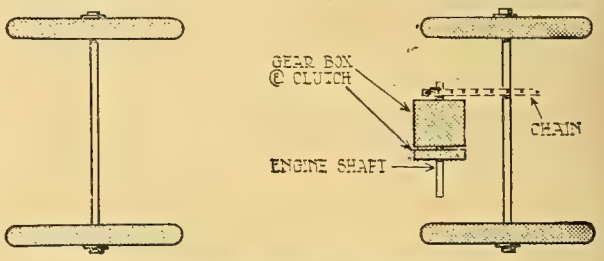

Fig. 2.—Transmission by gear box and chain.

Undoubtedly the machine—which can be called a "monocarette" on account of its small size—would suit the average person for runabout purposes. Carefully thought out, its weight would be in the neighbourhood of 150 lb. The comfort of such a machine would be undeniable. The body, with the aid of a storm apron, would keep its occupant entirely free from rain, while the mudguarding would be better than that on motor cycles, as there is more room for wide spacious guards on a four than on a two-wheeled vehicle. Provision for a second passenger would depend upon the position of the engine. If the latter were situated at the front, outspreading bars, with a dickey seat attached, could be clipped to the frame.

Now as to the price of the vehicle. With the ordinary methods of selling, it should be as cheap as many of the small lightweights.

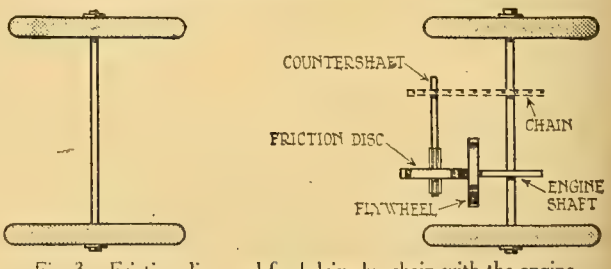

Fig. 3.—Friction discs and final drive by chain with the engine at the rear.

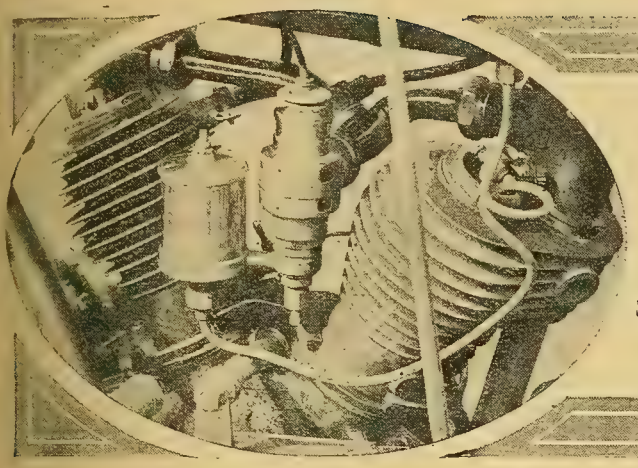
The monocarette should be able to carry—judging by motor cycle practice—including driver, over two hundredweight. After deducting 70 lb. for the driver, a boy, say, of fourteen years, we find that the vehicle should be able to carry a 150 lb. of goods. This would be the ideal weight for small grocers, chemists, confectioners, etc., who at present employ a cycle or tricycle carrier.

L.F.

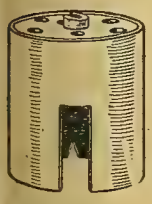


THE SINGLE LEVER CARBURETTER.

100 m.p.g. with a 3 h.p. Twin.

Some Tests and Experiments made with the Y Model Amac.

SOME little while ago—to be exact, on October 30th last—we described in detail the latest models of the Amac carburetter. Since the middle of December we have been making constant and careful tests with one of these instruments, viz., the Y model with vertical mixing chamber and horizontal outlet, on a 3 h.p. twin Enfield, and we may say at once with most satisfactory results.

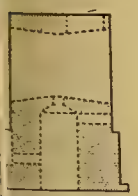


Throttle slide with slot seen from the rear.

We first fitted the carburetter exactly as sent out, and, though it started easily and ran well at first, we soon found that when the engine was warm the mixture was far too rich, and sooted plugs were the result. A smaller jet and lower petrol level effected a considerable improvement, but rendered starting more difficult and slow running a little less steady. We then fitted a choke tube having a smaller hole connecting the sprayer with the venturi. This had the effect of reducing the air for slow running on the pilot orifice, and gave even greater power when the throttle was fully opened.

Testing Out Adjustments.

This hole was bored out with a No. 41 drill, which gives a diameter of .096in., the pilot hole and air hole to the rear being of slightly less diameter. We have found by experiment that the orifices in the choke or adapter are of considerable importance, for we have obtained almost similar results from the several different throttle slides, of which examples are shown in the accompanying sketches.

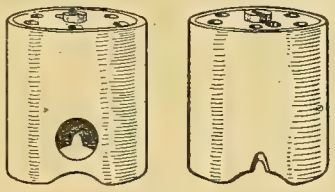


Section of choke tube, showing the petrol and air orifices.

For experimental purposes we fitted a small handle to the top air control, and cut the series of air holes into one continuous slot. This enabled us to arrive more quickly at our conclusions, but is unnecessary for general use, for we do not find that the position of the control requires to be altered while driving. It is perhaps desirable to warn riders against fitting too large a jet. We found that this might be considerably smaller than when a two-lever Amac was used; and a No. 23 (.023in.) gives very good results on our machine with the standard choke. Some riders are apt to increase the jet size with a view to obtaining more power, but unless the air can be correspondingly increased, this will not have the desired effect—rather the reverse—and plugs will suffer from a thick deposit of soot.

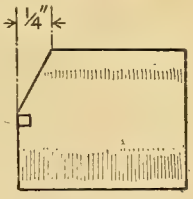
Sweetness of Running.

With a suitable adapter and jet, the Amac will give a good mixture at all throttle openings and all speeds. Probably the position of the pilot hole has the effect of equalising the suction of the main hole into the venturi upon the sprayer, thus preventing the mixture from becoming unduly rich as the speed rises. In practice the acceleration is excellent, slow running all that can be desired, and speed and power very good. The engine seems to settle down to its work as the throttle opens, as if it liked it, and with an entire absence of that feeling of labouring which is so objectionable to the sensitive driver.



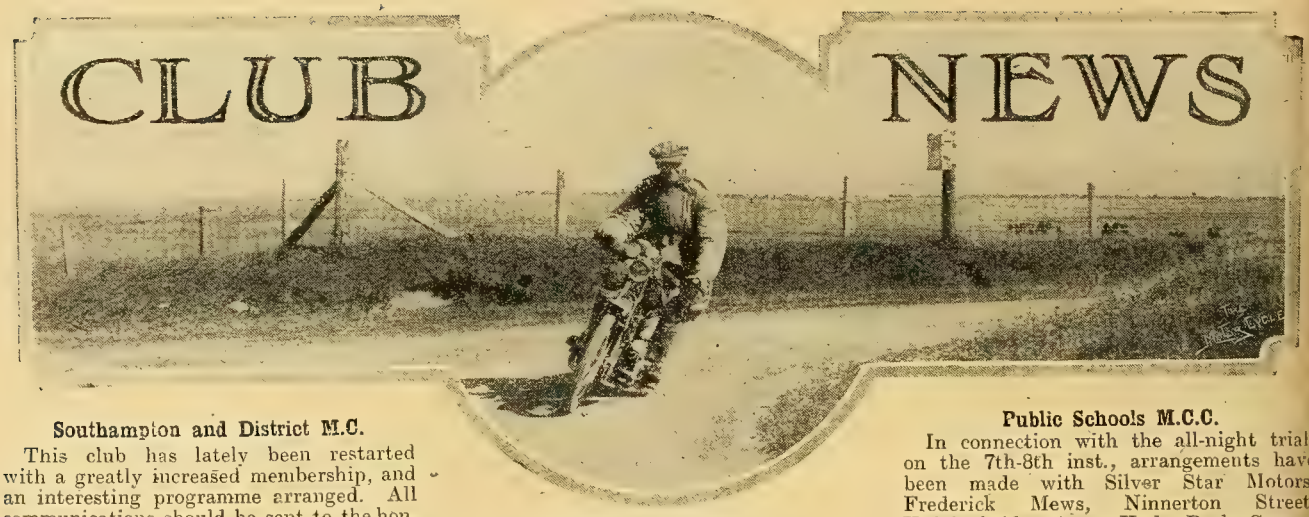
Back and front of the throttle slide.

Several tests showed that our machine fitted with the automatic Amac was slightly faster than a similar mount with a two-lever carburetter of the same make, but the chief improvement lies in the pleasant running rather than in the speed and power. In the matter of consumption we find that the automatic instrument is not quite so economical as the two-lever, but the difference is small, and the consumption is about 100 m.p.g.; and the fact that we have ascended a hill upwards of half a mile in length, having a rough surface and moderate gradient, at a speed approximately 40 m.p.h., shows that there is little fault to be found with the power that can be obtained when desired.



Side view of throttle backed off instead of cut out. This has proved most satisfactory.

CLUB NEWS



Southampton and District M.C.

This club has lately been restarted with a greatly increased membership, and an interesting programme arranged. All communications should be sent to the hon. sec., Mr. E. C. Prince, "Kenilworth," 90, Gordon Avenue, Southampton.

Stockport M.C.

The results of the recent hill-climb held at Axe Edge, Buxton, were as follow: Class 1 (500 c.c. solo)—1, T. Simister (Norton), 1m. 18⅘s.; 2, E. Abram (A.B.C.), 1m. 21⅕s.; 3, H. Swindeles (A.B.C.), 1m. 28⅖s. Class 2 (sidecars)—1, T. Simister (Norton sc.), 1m. 54s.; 2, R. W. Peel (Excelsior sc.), 2m. 42⅖s.; 3, J. Hulme (Indian sc.), 2m. 47⅘s.

North Notts M.C.C.

A new club has recently been formed in North Notts, under the name of the North Notts M.C.C. Two teams of this club will compete in the open speed trials at Chatsworth Park on Saturday. A char-à-banc will run from Worksop for the event. The hon. sec. of the new club is Mr. W. Pitchford, Westlands, Creswell, Notts.

Pyle and District M.C.

A very interesting circuit reliability trial was recently held under the auspices of the above club. The circuit, which was about ten miles, and included some stiff hills, had to be covered twice, the second time in the reverse direction. It was keenly contested, and no watches or speedometers were allowed. Results: 1, W. Bowden (4 h.p. New Hudson); 2, A. T. Bennet (4½ h.p. B.S.A. sc.); 3, G. Anderson (4 h.p. Triumph).

Essex M.C.

The annual twenty-four hour reliability trial organised by this well-known club will take place on September 10th next.

This event, which is confined to members, has hitherto been known as "The London-to York and Back Run." This year it will be held over a new course, which will prove more formidable, and certainly far more interesting, than the old route.

Intending competitors who are not already members should apply for membership at once. Full particulars of the trial can be obtained shortly from the organisers, Mr. F. A. Applebee and Mr. E. A. Colliver, 203, Great Portland Street, London W.1

Future Events.

Aug. 14.—Edinburgh and District M.C. Run to Carfraemill.
Aug. 14.—Harrogate and District M.C.C. Hill-climb.
Aug. 14.—Exeter M.C. and J.C.C. Reliability Trial.
Aug. 14.—Birmingham M.C.C. Hill-climb.
Aug. 14.—Dublin and District M.C.C. 100 Mile Handicap.
Aug. 14.—Sheffield and Hallamshire M.C.C. J. Thompson Cup.
AUG. 14.—WELSH EASTERN GROUP M.C.C.'s OPEN HILL-CLIMB.
Aug. 14 North Lindsey A.C. Run to Ashbourne and Dovedale.
Aug. 14-16. Oxford M.C. Week-end Run to Ludlow.
Aug. 15.—Falkirk and District M.C.C. Club Run.

Cambridge University M.C.C.

It is hoped to obtain the necessary permission from Lady Ludlow to hold a series of speed trials in Luton Hoo Park in the near future.

Public Schools M.C.C.

In connection with the all-night trials on the 7th-8th inst., arrangements have been made with Silver Star Motors, Frederick Mews, Ninnerton Street, Knightsbridge (near Hyde Park Corner) for garaging members' machines at a fixed charge of 1s., and the supply of petrol, oil, etc., up to 11.30 p.m.

Huddersfield M.C.C.

Arrangements are being made to hold a reliability trial of about eighty miles on August 15th. Local clubs are invited to take part, and their support will materially help to make the event a success. Full particulars may be obtained from the hon. sec., Mr. F. Dyson, Allen Dene, Netherton, near Huddersfield.

West Birmingham M.C.C.

This newly-formed club recently held a reliability trial to Hereford and back. Starting from the King's Head, Edgbaston, the course lay *via* Bromsgrove, Droitwich, Worcester, Old Wyche, British Camp to Hereford (lunch stop), the return journey being made over the Clee Hills—a total distance of 120 miles. There were twenty-nine starters, all of whom finished the course, though there were several failures on the Old Wyche.

Coventry and Warwickshire M.C.

The results of the recent half-day sporting trial, which included several water-splashes, are as follow: Solo class.—1, Meakin (4 Triumph). Sidecars.—1, S. Wright (4½ Humber sc.).

Local motor cyclists wishing to enter the club hill-climb at Stile Kop on September 4th should get into communication with the hon. secretary, Mr. F. Spencer, Priory Street, Coventry, respecting joining the club.

Warrington M.C.

Recently this North-west club held a trial over a sporting course through North Wales, including Chester, Rossett, Northop, Holywell and Llanarmon. Only six out of the original number of competitors who left Warrington checked in at the finish. Results: Winner of Blake Cup, S. Doward (7-9 Indian) who, although he failed on one of the observed hills, kept much better time than the rest of the competitors; sidecar prize, J. Roberts (6 A.J.S. sc.). Other competitors to finish were F. Parker (7 Ariel sc.), H. Aldred (4 Triumph), R. Caldwell (3½ Norton), W. Hollowell (3 Norton).

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

113 M.P.G. WITH A SCOTT.

Sir,—Many Scott riders will be much interested in "Not Infallible's" remarkable consumption figures.

I was not aware that the Degory carburetter was made in motor cycle sizes, and I shall be glad to receive further information from your correspondent; particularly as to how his machine behaves in starting from cold and running light. Also if he is troubled with the peculiar pre-ignition trouble which sometimes occurs on these machines when running with a weak mixture.

The address of the manufacturers of the Degory carburetter would also be acceptable information. 75 M.P.G.

New Moston.

[The makers of the Degory carburetter are the Degory No-jet Carburetter Co., 93, Moore Park Road, Fulham, S.W.6. —ED.]

RULE OF THE ROAD.

Sir,—Having received a police summons some months ago for driving on the wrong side of the road in College Green, Dublin, and having been fined 10s. for that offence, I was rather surprised to see "the law" recently allow a car to commit the same offence in the same place without stopping it or taking its number.

On the occasion on which I broke the law the official on point duty was standing on the extreme left so that I did not notice him, and so my offence was a pure mistake.

The car I mention, however, passed in the other direction and as Robert was therefore standing on its extreme right one may be able to gauge the extent to which that car broke the law in passing on his right. There is a strong contrast between this case and mine and its subsequent treatment by the police, and while the complaint is, in a sense, comparatively unimportant, it goes to show that the guardians of the law sometimes break the law themselves, and that very often it appears there is one law for one individual and quite a different one for another.

I may add it was the same official who summoned me for my offence and let the car mentioned go by unheeded.

ONLY OFFENCE.

LACK OF FINISH.

Sir,—"Disappointed," I am afraid, is only one out of many sufferers, with regard to his experience with a so-called aristocratic motor cycle. I, too, paid umpteen pounds for a V twin fitted with an engine of reputable make, and although I have had no serious trouble with the engine, the details of the machine seem to be lacking that finish which is so loudly claimed by the firm in question. The back stand will not clear the chain case, and has consequently rubbed through it, whilst the controls and kick starter have caused me much annoyance and unparliamentary language. Of course, one refrains from doing so ungentlemanly an action as giving names; but when a good price (no mean thing these days) is paid for a machine, one expects good results.

CHARGE ENGINEER.

Lancs.

Sir,—Having noticed some letters from time to time in *The Motor Cycle* with regard to the finish of new machines, I thought my experience might be interesting.

In February last I bought a 1920 2¾ h.p. two-speed Diamond. The machine was quite ready for the road when taken out of its crate, while the finish and workmanship were beautiful. I have since covered over 2,000 miles, chiefly on business, in all winds and weathers, over some of the roughest and most hilly parts of Devonshire, and have had no trouble at all worth mentioning.

I might add that I have no connection whatever with the makers of the Diamond nor with the motor trade.

In conclusion, I should like to thank you, Mr. Editor, for the hours of interesting and instructive reading I get out of *The Motor Cycle*, which is invaluable to a novice like myself.

WEST-COUNTRYMAN.

SPARKING PLUGS IN TWO-STROKES.

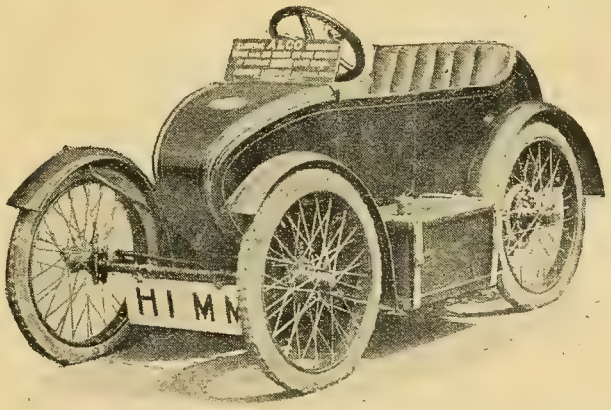
Sir,—Letters constantly appear in your columns complaining of poor service of sparking plugs in two-strokes, and what is referred to as the two-stroke clang, and, as I have neither of these troubles apparent in my two-stroke, I am rather interested in the cause.

My machine is a 2¼ h.p. Royal Enfield, and, in view of the solid workmanship about the engine, I should feel inclined to think that possibly some makers invite the objectionable clang by cutting matters too fine in an endeavour to secure thorough cooling. The Enfield has very deep fins, and I have never yet been able to dry it up.

As to the plugs, I have the original one still running after a very considerable mileage, and I think I can suggest a probable cause of riders' trouble with plugs. The usual advice given to riders as to timing the two-stroke is—points breaking with ignition fully retarded and piston at top dead centre. This is correct enough, but the trouble arises through the bulk of small two-strokes being fitted with *fixed* ignition, and I fancy many of them adopt the above timing. For everyday running I prefer to time on full advance, and set my ignition as follows: Points breaking (ignition if variable fully advanced), piston ¼in. before top dead centre. If top dead centre is marked on the flywheel, the above position may be attained by moving the flywheel in the reverse direction about 1¼in.

I trust the above may be of use to someone, and should like to hear other experienced riders' opinion on it.

J. STUART WHITE.



A British-made electric monocar manufactured by A. Lyon and Co., Victoria Street, S.W., and which runs thirty miles on one charge at an average speed of 10 m.p.h. It is intended for the use of ladies for shopping purposes, and also for invalids and cripples.

COURTESY.

Sir,—On Sunday morning, July 4th, at three o'clock, I was returning from the South Coast on a club night trial, when I came across two riders on a Harley-Davidson outfit who were stranded for the want of a tyre valve seating. I had a spare one with me, and had the pleasure of fixing them up and probably saving them a long walk and longer wait. They took my name and address, but have not had the decency to replace the spare. On Saturday, July 10th, I lent a plug to the rider of a Triumph outfit, and he has treated me in the same unsportsmanlike way.

It seems to me that the genuine motor cyclist, who keeps his machine in decent order and very seldom requires to make roadside adjustments, carries his spares for the benefit of these riders, who take their chance of a breakdown, knowing that they will be able to "sponge" on someone or other. DISGUSTED.

Purley.

ON THE ROAD.

Sir,—In touring about the country one sees some very astounding attempts at motor car and motor cycle driving. But for the seriousness of the matter, I think it is really amusing to witness some of the various "stunts" which are attempted in driving round dangerous corners. One comes across a large number of so-called motorists, who are apparently quite new at the game, and unfortunately possess only a very small knowledge of the rules and courtesy of the high road.

When one witnesses a motor car or sidecar outfit being driven round a difficult left-hand bend (without sounding the horn at all) at speed (after previously passing a danger sign), and consequently swerving on to the right-hand side of the road, one wonders, first of all, if the driver has any brains at all, and, secondly, how he can reasonably expect to avoid an accident, in the event of his meeting another vehicle coming in the opposite direction just round the corner. The deliberate manner in which these "experts" ignore the danger signs referring to dangerous cross roads, and simply dash helter-skelter over the crossing, is really astounding.

The following points of advice, which I have taken from the very excellent article by Mr. Max Pemberton in a daily paper, should, I think, be of great service to motorists generally, and particularly to the above-mentioned "amateur experts":

1. At a cross road do not regard the blowing of your horn as the whole duty of man or woman. If you blow and carry on, the other man may do the same. The coroner will interview the survivor.

2. Have your argument as to which was the main and which the side road before, and not after, the accident. Dogmatism is no compensation for a fractured skull.

3. Never overtake another vehicle upon a corner round which you cannot see. There are easier roads to suicide.

4. Remember, if you are coming from a byway into a main road, that if you have to turn to the left you will be going with the stream of traffic (provided you keep on your own side); if to the right, you are cutting dead across it, and must be prepared to stop in a yard.

5. Do not try to show off. The man who drives within a foot of danger may also be within a foot of the grave. In this case a mile is better than a miss.

6. Directly you begin to race with another car on the high road you are in danger. Go to Brooklands if you want to test the efficiency of your engine.

7. A good driver is one with a wide outlook. He sees the child who is about to run across the road. The other fellow sees nothing but the road ahead of him.

8. Having taken a decision, stick to it. The man who hesitates is lost. Remember that the other driver may be watching your movements, and depending upon them.

9. Never in a narrow road overtake and try to pass another car until the driver is aware of your presence. Men lie under tombstones who have done this thing.

10. Remember that courtesy was once a great tradition of the high road. We should seek to maintain its splendid story.

11. Finally, drive as you expect the other man to do. There will then be no need to appeal to the insurance companies. HAROLD E. HILL.

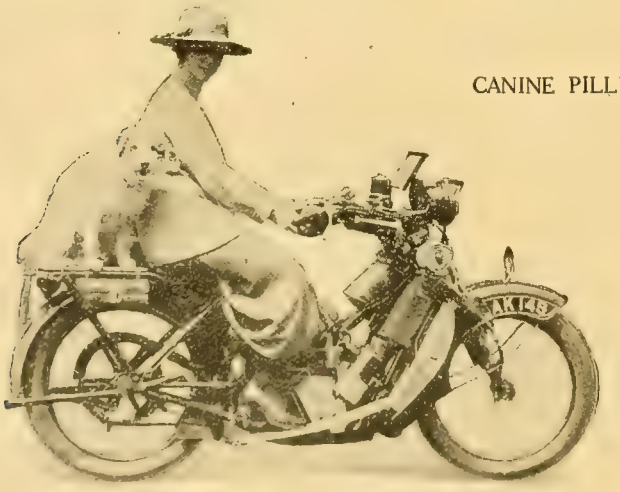
CANVAS BELT.

Sir,—I think perhaps the following tip may be useful to some of your readers. I use my 7-9 h.p. Rudge Multwin and sidecar for business purposes, and consequently have to face all weathers. At first I experienced belt slip in wet weather, but have now entirely overcome this by using a belt from which the rubber has been worn away from the sides and by cutting away the rubber from the underneath side until it is quite level and smooth. My contention is that the slipping is caused by the wet holding in the grooves on the bottom of the belt, and when it passes over the engine pulley the wet is forced out of these grooves and causes the slipping. It is only a matter of a couple of minutes to change your belt.

I have been running this outfit since May last, and have to undertake some long journeys and not once has it failed me. ALLWEATHER.

Birmingham.

CANINE PILLION PASSENGERS.



The motoring dog is as much a reality as the motoring child, and the intelligence of the canine pet in connection with motor cycles is sometimes almost uncanny. For example, it can distinguish the engine note of its master's machine from others which may be in the vicinity. Above are depicted a lady and her pet on a Scott, and a Clitheroe rider, Mr. G. A. Earle, who regularly travels with his dog on the carrier.

Henderson SIDE CARS

SCOOTERS.

Sir,—From public remarks that I heard after the scooter race at Fallowfield, it was evident that this class of machine is not quite understood as regards general efficiency, and has not up to now been given the publicity it deserves. When one considers that the race was run in a downpour of rain, with the track three inches under water in places, it proves that these machines are not built for fair weather riding only; also every machine that started finished. So much for speed. I was asked several times if scooters could be relied upon to do journeys of fifty miles or so. This distance has already been covered by that excellent little machine, the Whippet, and I think that it is due to the interested members of the motor cycling community, both present and future, that some performance figures based on *weight and horse-power* should be available.

I would be very pleased to meet any owners of scooters, both private and trade, with the idea that suggestions could be made with the hope of forming a reliability trial.

J. D. TIMMINS,
MINATUR AUTO SCOOTERS.

TRANSPORT DELAYS.

Sir,—I would like to bring before your readers an example of post-war delay to goods on the railway which, I believe, has been sent up to the Ministry of Transport as a test case.

On May 24th, owing to ignition trouble, and being pressed for time, I was compelled to leave my motor cycle at Biggar—180 miles from my destination—to be forwarded on per goods train.

It left Biggar on May 28th for Earlestown (Lancs.). On June 7th having no word of it, I sent in a claim to Earlestown—the claim was declined, as no advice had been received.

During the next ten days the railway company were asked whether they had received the advice, or whether they had traced the machine. They answered in the negative, the excuse for the delay being the damage on the line at Barton, although I knew that normal service had been resumed on that line by the 3rd June.

On June 17th, I learnt that the machine had left the Caledonian at Carlisle on June 5th. I then thought of the A.A., and wrote off to their Manchester office without further delay.

Thanks to their efforts, the cycle turned up eventually six days later.

E. J. BORRON.

SEASIDE MANNERS.

Sir,—The remarks of one of your correspondents *apropos* the disgusting behaviour of some motor cyclists at fashionable seaside resorts are as deplorable as they are true. I have just returned from Southport, where exists a similar state of affairs to those at Eastbourne. Southport lends itself admirably to any display of the nature indicated—a fact which is appreciated. At this admirable place the knut seems to spend his leisure—very considerable leisure, too—in "lapping" Lord Street and the Promenade in a praiseworthy conscientious manner. He leaves behind him a "powerful" noise, smell, and impression, although it must be admitted that sighs of envy and surreptitious glances of admiration follow his retreating brilliance as well. Such futility and ostentation are incomprehensible when one recollects that fine stretches of "speed" sand are available on the foreshore most mornings before breakfast. Most of the "regular" machines are indifferently driven, and are obviously not intended for serious work; indeed, I often saw an ancient Triumph stripped of mudguards, etc.!

Perhaps the most effective (?) performance I witnessed—it left me faint, almost—was that of a *blasé* youth who drove his two-stroke along Lord Street sitting *side-saddle* (greatly unconcerned), the while his admiring friends, with their hog-'buses, congregated in a group and effectually blocked part of the roadway. This was, however, eclipsed by a flapper of few summers and less scruples, who repeated the performance, riding through a denser crowd, the following evening! There was a policeman on point duty less than one hundred yards away who probably saw the above incidents.

Apparently this conduct can go on with impunity, while *normal* motor cyclists get fined for incorrect numbers, etc. It makes one feel inclined to go back to the push-bicycle.

Newcastle-on-Tyne. NORTON.

CARBURATION.

Sir,—Mr. S. T. Williams, in his letter on "Carburation" in your issue of July 15th, seems to lose sight of the inherent properties of the internal combustion engine. To obtain power from such an engine one must obtain "revs." Referring to a 4 h.p. engine, to develop its 4 h.p. at a certain number of revolutions, he remarks: "But suppose the full 4 h.p. (or as near as possible thereto) is wanted at a much less engine speed. . . ." No possible combination of tap-twiddling will do this, and, if it did, heaven help the transmission.

I maintain that the two-lever carburetter is more foolproof than the single lever. The vast majority of riders imagine that to get maximum acceleration one must bang open the throttle fully like a steam engine. On most two-lever carburetters this is mercifully counteracted by the air slide, which acts as a throttle, and is an unsatisfactory expedient. A well designed and properly adjusted single-lever carburetter, skilfully opened up, will give the engine the exact quantity of correct mixture that it can consume in its maximum acceleration.

I have recently fitted an Amac single-lever carburetter to my 1914 6 h.p. Enfield, and the increase in power, acceleration, and slow running is equal to and better than many 1920 machines of many makes with various carburetters. When crawling in traffic I always run on low gear. My machine has two gears only. Thumping an engine over on high gear with a rich mixture is not skill; it is ignorance. The petrol consumption is about the same as before, but is really improved, considering the increased speed up hills, which abound in my district. A single-lever carburetter requires a good deal more careful tuning than the two-lever, and this is why the two-lever still finds many supporters; but, once in tune it remains so, if the same spirit is used and the engine kept in proper trim. The adjustment for atmospheric conditions is simple, and more certain than guessing at it with an air lever.

T. R. DRUITT.

MYSTERIOUS NOISES.

Sir,—The article, "Mysterious Noises," in your issue of July 15th, reminds me of an amusing experience I had some time ago.

I was driving an ambulance (Studebaker 6), and went to a Welsh seaside resort to bring an invalid lady back to Liverpool. The car ran A1 till starting on the homeward journey with the patient, nurse and luggage in the ambulance. Immediately on starting the car a decided squeak was noticed which ceased as soon as the car was stopped for examination; nothing however could be found amiss, so the car was restarted, when the squeak immediately started again. Another stop was made for a further inspection but without result, but on starting again the nurse opened the front of the ambulance, and I noticed a fox terrier dog sitting on the bed in the ambulance who did not like the motion of the car and showed it in his canine way by making a noise like a hot bearing.

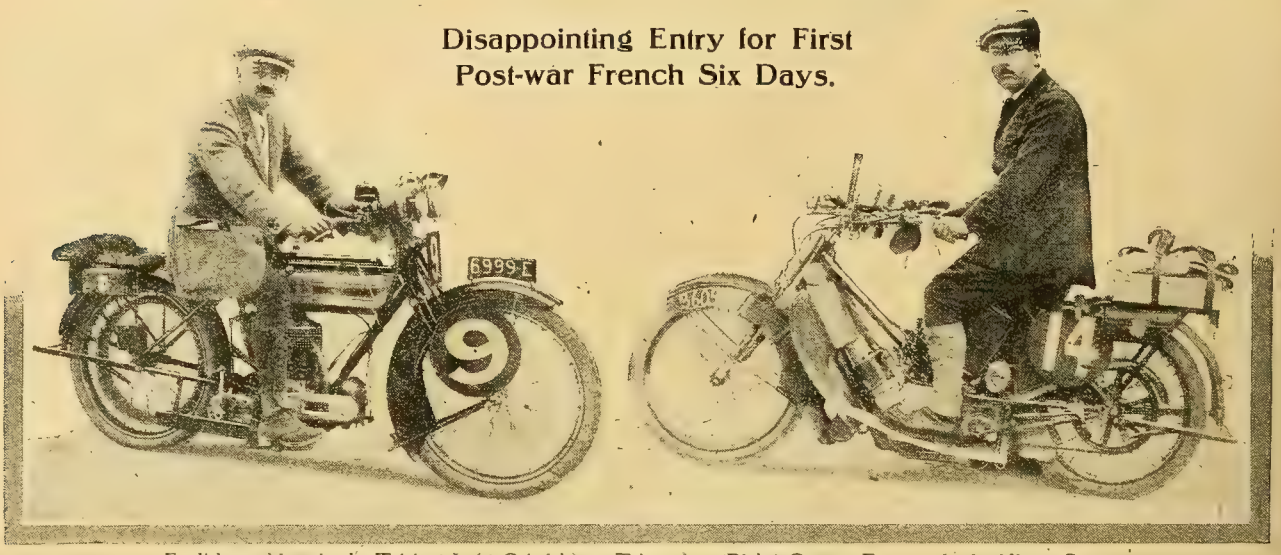
The International Six Days Trials in France.

Disappointing Entry for First Post-war French Six Days.



English machines in the Trial. (Left) Gabriel on a Triumph. (Right) Graeme Fenton who is riding a Scott.

IT was most disappointing to the Union Moto Cycliste de France that their first post war Six Days Trials in the French Alps attracted so few entries. Only fifteen competitors started on the 25th ult., several entrants failing to reach Grenoble for various reasons. Bad luck seems to have pursued the organisers this year and every sportsman will no doubt sympathise with them. First of all, the unsatisfactory ending of the Paris-Nice Trial, which was declared null and void owing to the breakdown in the checking organisation, seriously affected the number of possible entries from England, although the Paris-Nice event was not organised by the same body. Then, having secured an entry of twenty-two, only fifteen started. M. Mahieu who was entered on a Rudge, had an accident which ended fatally. A Gillet rider—Sermens—was prevented from starting by illness. Lucas (Zenith), Barron (Harley-Davidson), and H. O. Wood (Scott) did not cross the Channel. Then the Magnat-Debon, a French machine, was absent, and Gold (Wolf), an English competitor, although in France, arrived late at Grenoble.

By July 24th most of the competitors had arrived, and those who knew the roads were of the unanimous opinion that no touring competition previously held would prove so strenuous. They prophesied that all the Six Days Trial men would be penalised and that certain sections of the road could not be covered at the average speed imposed without the risk of smashing the machines.

The regulations provided that the organisers had the right to add certain tests, notably hill climbs, consequently the Union Motor Cyclists de France decided to include Laffrey hill in the second portion of the first day's route.

The weighing operations were in charge of M. Longuemare, Vice-president of the Union Moto Cycliste de France, while M. René de Knyff—that grand old sportsman whose name has been associated with every important race and trial held in France since the beginning of motoring—arrived from Paris by motor cycle. He is President of the Union Moto Cycliste de France.

Competitors started at seven o'clock from the enclosure for the hill-climb at Vizille. There was a control at Corps where the riders had a thirty minutes interval.

The competitors were sent away in the following order on the first day :

SOLO MACHINES.

Graeme Fenton (Scott).
Bernard (Indian).
Yenné (A.B.C.).
Detruche (A.B.C.).
Barthélemy (Scott).
Naas (A.B.C.).
André (Motosacoche).
Borgotti (A.B.C.).
Gabriel (Triumph).
Morand (Condor).
Rolly (Motosacoche).
Pinney (Triumph).

SIDECARS AND CYCLE CARS.

Gex (Motosacoche).
Gallien (Benoist-Gonin).
Sandford (Morgan).

The course was divided into six sections of 45, 42, 39, 42, 35, and 40 kilometres respectively: Grenoble (start), Seyssinet, St. Ninier, Pont de la Goule Noire (45 kil.), control; La Balme de Rencurel, Pont-en-Royans, Saint-Jean-en-Royans, Leoncel (88 kil.), control; La Vacherie, Plan de Baix, Blacons, Saillans

Le Pond-d'Auris—On the course of the International Six Days Trial. One of the attractions of the Trial is the magnificent scenery through which the course passes.

Borgotti (A.B.C.) in the heart of the French Alps.

(127 kil.), lunch; Pontaix, Chamaloc, col due Rousset (169 kil.), control; tunnel of 630 metres, Rousset, St.-Martin-en-Verons, St.-Julien-en-Noire (204 kil.), control; Les Jarrants, Sassenage, Grenoble (244 kil.), finish.

THE SECOND DAY.

On the 27th ult., the Laffrey hill-climb, taken in the course of the trial, took place in rainy weather. The results in the various classes were as follow:

350 c.c. CLASS.

		m.	s.
1.	Morand (Condor)	12	55

500 c.c. CLASS.

		m.	s.
1.	Borgotti (A.B.C.)	8	3
2.	Yenné (A.B.C.)	8	23
3.	Rolly (Motosacoche)	8	41
	Gabriel (Triumph)	8	5⅗
	Detruche (A.B.C.)	9	3⅗
	Naas (A.B.C.)	11	9
	Robert (Motosacoche)	13	12⅘

750 c.c. CLASS.

1.	Pinney (Triumph)	10	5⅘
2.	Barthélémy (Scott)	11	4⅘
3.	Graeme Fenton (Scott)	13	38⅘

1,000 c.c. CLASS.

1.	Bernard (Indian)	6	49⅘

1,000 c.c. CLASS.—SIDECARS.

1.	Gex (Motosacoche)	11	17⅕

1,100 c.c. CLASS.—CYCLE CARS.

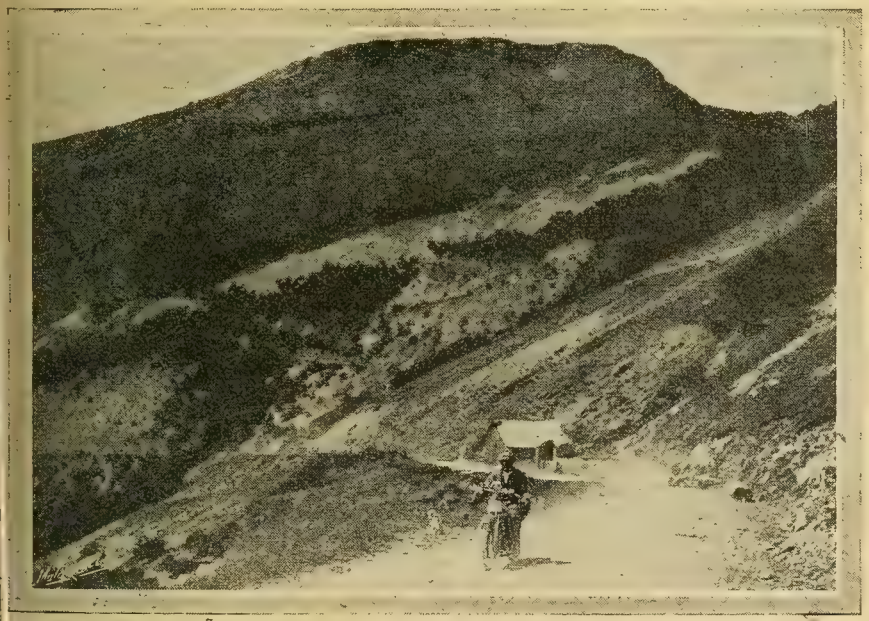
1.	Sandford (Morgan)	11	7⅘

The best time was made by Bernard (Indian), who won the Vizille Cup. The record for this hill-climb was established by Guiguet, on a 350 c.c. machine, in 1914; time 5 min. 36 sec. It will be noted that this time was not beaten, but it appears that Guiguet rode a racing machine while those entered for the Six Days Trials were naturally touring models.

The second stage of the trial appears to have been less difficult than the first stage, from the point of view, at any rate, of the steepness of the hills and the nature of the road surface, nevertheless there were more penalties on the second day than on the first. Tyre troubles are beginning to show themselves, but the machines stood up well. The day's run began with the timed hill-climb, the results of which we have just given. The competitors then continued as far as Corps, where the second start was made on the hill test. It seems, however, that there was a misunderstanding, as several competitors turned up late at Vizille, thereby running the risk of penalisation. Detruche (A.B.C.) hurt himself in the previous day's run after a fall caused by a dog, and lost three marks. He also suffered several punctures, and broke his saddle. Yenné, riding a similar machine, lost his way, and had two punctures—one in the front and one in the back wheel—and lost nine marks. Graeme Fenton (Scott), unfortunately, had to retire also, through a fall caused by riding in a cloud of dust which hid a corner. His machine was seriously damaged, but he managed to patch up his mount, and arrived in time at the next control, when a side-slip finally put him out of the running.

There were now thirteen competitors in the trial, and eleven who had probably lost no marks. Further particulars of this event will be given in our next issue.

Bernard (Indian) re-starting from an Alpine village.



Andre (Motosacoche) climbing one of the long but splendidly graded hills in the trial.

A.C.U. SIX DAYS TRIAL.

Routes and Entries for this Year's Big Event in the North-eastern District of England, to be held from Monday, Aug. 23rd, to Saturday, 28th, Inclusive.

ON the point of the number of entries, the success of this year's A.C.U. Six Days Trial is assured. We are able to give this week a list of 120 entries received by the Auto Cycle Union.

As has already been stated, Darlington will be the centre for the first four days, the fifth day's route being a run from the North to the Midlands. The competitors will stop at Coleshill, Kenilworth, Warwick or Leamington, according to their numbers, and on the sixth day will ride to Brooklands for speed and brake tests and final examination.

On this and the following page we are able to give maps and particulars of the first five days routes.

The names of the observed hills will not be published, but the following are the principal hills to be climbed: Rosedale, Abbey Bank, Boltby, White Shaw Moss, Buttertubs Pass, and Park Rash.

MONDAY, AUGUST 23RD. 161½ MILES.

Schedule Time of Leader.		Mileage. Intermediate.	Total.
a.m.			
8.0	Darlington	—	—
8.12	Croft	4	4
8.30	Great Smeaton	6	10

LIGHTWEIGHT TRIAL RESULTS.

THE official results of the recent Birmingham M.C.C. lightweight trial to Chepstow and back show that no fewer than six competitors lost no marks, and therefore tie for the premier award. These were: E. J. Bastock (2½ Levis), R. E. Pugh (2½ Levis), J. C. Walker (2½ Edmund-Jap), A. R. Edwards (2½ Levis), Eric Williams (2½ Velocette), and G. Kuhn (2½ Levis). These ties will be decided in a later event. The best amateur performance was made by E. J. Bastock; and the silver medallists were G. Denley (2½ Velocette), W. R. Urwin (2½ Levis), and B. Kershaw (2¼ Verus).

In the touring trial for larger machines run concurrently with the lightweight event the following secured the chief awards in their respected classes:

L. Paynter (3½ Norton), W. A. Eggington (4 Sunbeam), R. A. Fawcett (4¼ B.S.A.), and H. H. Peters (4 Triumph) tied, W. T. Woodcock (3½ Ariel sc.), A. H. Edwards (4¼ James sc.), and B. Bladder (8 New Imperial sc.).

Best Amateur Performance: A. H. Edwards (4¼ James sc.).

In addition there were no fewer than thirteen silver medal winners.

LONDON TO HOLYHEAD.

Holiday Event for the Maude's Challenge Shield, organised by the Ealing and District M.C.C., proved to be a hard Trial.

THE Ealing and District M.C.C. held their first London-Holyhead Trial on 31st July and 1st August, starting from Cranford Bridge. Unfortunately the trial attracted only sixteen entries, of which number only one (W. J. Phillips, 10 h.p. Deemster light car) failed to start. The course proved to be a very severe one indeed, including as it did the crossing of Machynlleth and the ascent of Bwlch-y-Groes. The former was taken in the opposite direction to that of the English Six Days in 1919, and Bwlch-y-Groes took its usual toll of gold medals. The first competitor was despatched by Dr. Low at midnight, and the course followed the Bath Road to Reading, and thence through Faringdon and Gloucester to Hereford, where one hour and fifteen minutes were allowed for breakfast. At this point the first check was held, and most of the competitors arrived to time. Here S. A. Lees (2¾ h.p. Priory), arrived late, having suffered trouble with slipped magneto timing, and decided to retire. The next point of interest was just beyond Rhayader, where the first observed hill was found, and on the summit of which the secret check was instituted, which is only to be used to decide the winner of the shield in case of a tie. The hill did not present many difficulties, and several competitors were caught considerably early.

From here we rode in company with H. Welsh (2¾ Priory) and J. Harrison (3 Calthorpe), both of whom had great difficulty with slipping belt after the many watersplashes encountered.

A Difficult Descent.

Conditions now stiffened considerably, for after climbing up to Van Mines via Stay-a-Little, an old English six days friend, the mountain was descended on the Machynlleth side. The surface was appalling, being composed of large slabs of rock, water gulleys running across the road at various angles, and two cart ruts several inches deep.

Lunch was arranged at Bala, but Bwlch-y-Groes had to be climbed *en route*. Clean ascents were made by W. G. Bower (5-6 Rover), D. D. Tilt (4 Triumph), A. G. Battley (4 Triumph), Mrs. O. M. Knowles (3½ Norton), George Nott (8 Matchless sc.), and Rex G. Mundy (10 G.N. light car).

Here there were no observed hills or checks until Holyhead was reached, where F. T. Bidlake timed in the ten survivors. The awards will be decided on the basis of climbing all observed hills, adherence to schedule, and, if a tie should result, the secret check will be resorted to—but only in the event of a tie. The following finished within their respective time limits:

F. S. Spouse (10 T.B. cycle car).
W. G. Boyer (5-6 Rover).
D. D. Tilt (4 Triumph).
A. G. Battley (4 Triumph).
P. Cunningham (3½ P. and M.).
Mrs. O. M. Knowles (3½ Norton).
Capt. R. M. Knowles (3½ Norton).
George Nott (8 Matchless sc.).
T. J. Ross (8 Matchless sc.).
Rex G. Mundy (10 G.N. cycle car).

A remarkable performance was put up by Mrs. Knowles, who, although she had an accident near Festiniog, damaging her handle-bars, controls, and tank, managed to finish within her time limit.

It is proposed that a permit be asked for from the Auto-Cycle Union for this event to be made open next year. If this is done, it is to be hoped that the trial will be better supported, as it undoubtedly deserves to be with such a sporting course.

We were truly sorry for F. T. Bidlake, whom Longman took over the worst part of the course in his sidecar, and endeavoured to arrow the route in addition to arriving at each check before the first competitor. It speaks well for his 3½ Ariel that it accomplished what it did.

ENGLAND v. HOLLAND.

Next Saturday's International Motor Cycle Trial from Maastricht (South Holland) to Amsterdam. Third of the Series.

INSTITUTED in 1912, the third Anglo-Dutch trial is to be held in Holland on Saturday, the 7th inst. Eighteen British and a similar number of Dutch riders, each team composed of nine amateurs and nine trade representatives, will compete over a course divided into three sections and extending from Maastricht, on the Belgian-Dutch border, to Amsterdam. A mass of checking stations have been arranged on the course of approximately 150 miles, and regularity in running is to settle the final destination of the "N. M. V. Beker," presented by Messrs. J. Ferwerda and A. Citroën in 1912. Controls have been arranged at Zeuls and Utrecht, besides secret checking stations. The start is at 7 a.m.

The Anglo-Dutch trial is a growingly popular event. Its origin is interesting. In 1911 a pary of keen Dutch motor cyclists journeyed to the Isle of Man to witness the T.T. Races of that year. On their return, an invitation was extended to *The Motor Cycle* to organise a team to compete against an equal number of Dutch motor cyclists, which suggestion we readily acted upon, and a representative team duly arrived in Holland full of confidence in success. But Dame Fortune decided that a German magneto should be deranged on one British mount, and as a result the rider retired and lost the maximum number of marks for his team at successive controls. Holland thus won deservedly.

The following year, a Dutch team visited England, Oxford being the starting and finishing point of the trial, organised by the A.C.U. Hills are almost non-existent in Holland, and when the Dutchmen saw—and felt—Kop, near Princes Risboro', they fell off like shelling peas. England thus won comfortably in 1913. The war upset the return trip to Holland in 1914, which was to settle the ultimate winners of the Trophy, and next Saturday's contest represents the postponed event.

A strong British team crossed over to Antwerp from Harwich on Tuesday evening last, and were due at Maastricht, South Holland, to-day (Thursday). The Dutch folk are extremely hospitable, and an interesting programme in commemoration of the visit had been mapped out. There was to be a reception by the Maastricht Council this evening at a dinner to the international riders.

In the trial on Saturday the Dutchmen will mostly ride American-made machines. The British riders are, of course, to a man astride British mounts.

The 1920 British team selected is as follows:

UNDER 500 C.C.—*Private Owners:* T. Rutherford (3½ Sunbeam), Geoffrey Smith (3½ Sunbeam), Lt. Glen Kidston, R.N. (3½ Sunbeam), and E. A. Edwards (reserve) (3½ N.U.T.). *Trade:* W. B. Gibb (2¾ Douglas), H. Gibson (2½ Clyno), and J. A. Newman (3½ Sunbeam).

OVER 500 C.C. SOLO. *Private Owners:* D. H. Noble (5-6 Rover), F. A. Hardy (5-6 Zenith), F. Dover (4 Triumph), and G. W. G. Codd (reserve) (10 Reading-Standard). *Trade:* Kaye Don (6 Zenith), L. Newey (6 Ariel), and G. W. Moffatt (4 Douglas).

SIDECARS.—*Private Owners:* G. H. Boynton (5-6 James sc.), C. Crossthwaite (5-6 James sc.), W. A. Fell-Smith (8 Blackburne sc.), and S. Bannon (reserve) (7-9 Harley-Davidson sc.) *Trade:* C. R. Collier (8 Matchless sc.), H. A. Collier (8 Matchless sc.), W. Pratt (6 A.J.S. sc.), E. B. Ware (reserve) (8 Matchless sc.), and H. F. S. Morgan reserve) (8 Morgan).

BROOKLANDS AUGUST MEETING.

TAKEN as a whole the August Brooklands meeting was a success in spite of the weather, though, obviously, a great number of visitors must have been kept at home by the series of annoying showers. Small cars had the second race, which was the third light car short handicap, to themselves, and E. B. Ware's red Morgan won a fine race, covering the five and threequarter miles at a speed of 68.5 m.p.h., well ahead of the field.

Unfortunately, Frazer Nash's famous G.N. suffered from a bad side-slip while just behind Bedford's Hillman as both cars were entering the railway straight. The G.N. turned round completely, then crashed into the foliage and through the fence on the railway side. Nash, by a miracle, escaped with minor injuries, though the car turned upside down.

The second light car long handicap was won by Ware (Morgan) at 69.5 m.p.h. Hawkes (Morgan) won the cycle car short handicap at 64 m.p.h.

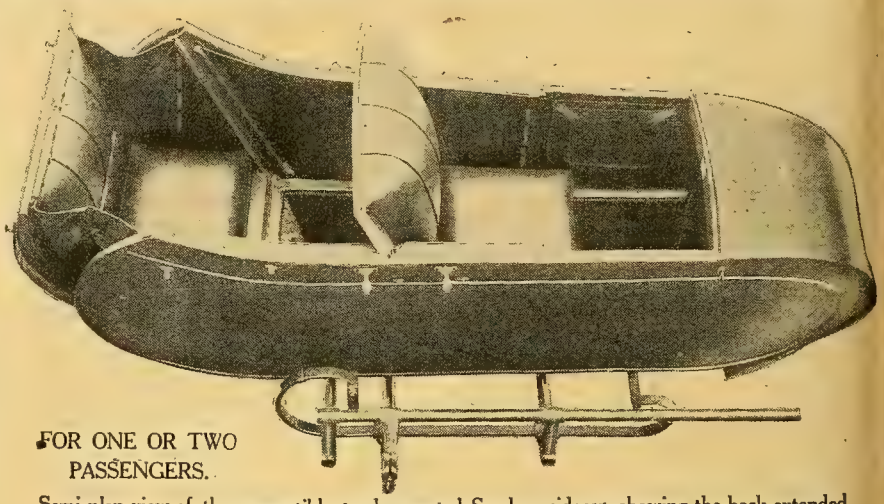
NEW IDEAS IN SIDECAR DESIGN.

A Convertible Tandem Seater—an Australian Design. Sporting and Touring Types.

THE popularity of the sidecar increases day by day, and as a result new models are constantly being introduced to meet the demand. Compared with the pre-war product, the sidecar of to-day is a vastly improved article, and this is a point which should be borne in mind when prices of the two periods are compared.

Illustrated on this and the following page are new sidecars to suit the various requirements of different drivers, from the owner of a sporting machine to the one who wishes to accommodate his family.

The first machine illustrated is a convertible tandem seater, produced by the Sandham Engineering Co., 336, Gray's Inn Road, London, W.C.1, and seems to have overcome a number of difficulties. As may be seen from the plan view of the sidecar, additional length is afforded in the body by extending the rear back rest. A pit is arranged for this passenger's feet. The side pieces which limit the angle of the rear back rest are reinforced by a strip of stout leather running through the centre.

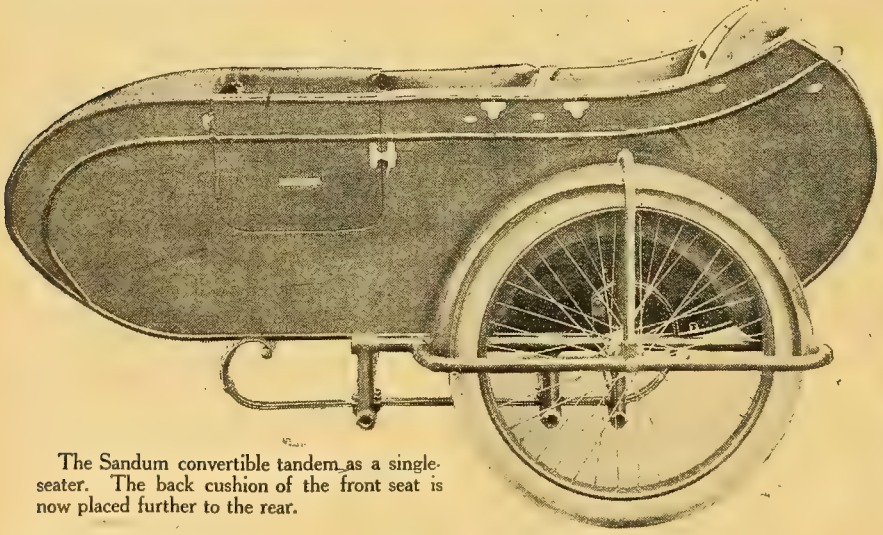


FOR ONE OR TWO PASSENGERS.

Semi-plan view of the convertible tandem-seated Sandum sidecar, showing the back extended for the accommodation of a second passenger.

dash over the nose show consideration for the passenger's limbs. A change of position is rendered possible by a movable seat, the semi-reclining position favoured by some passengers being possible, but is left a matter of choice. The makers say that it is neither a flying camp bed nor a portable lounge chair, rather is it a compromise between the two, and, therefore, likely to have a wider appeal.

The price of this attachment is £22.



The Sandum convertible tandem as a single-seater. The back cushion of the front seat is now placed further to the rear.

When it is required to carry one passenger only, a very neat method is used for converting the body into a single-seater. The rear seat is placed on end, and rests against the rear back rest, which latter falls forward and follows the contour of the rear of the body. The front back rest, which is held in two grooves, is removed and placed in similar slots at the rear, whilst the front seat slides back an equivalent distance. The change can be made in a few minutes.

This model is to be handled in London by Dunhills, Ltd., 359-361, Euston Road, London, N.W.1.

A sporting type sidecar—but not so "sporting" as to be uncomfortable—is the Stanford Classic, manufactured by the Stanford Sidecar Co., of Sampson Road North, Birmingham. It is as wide and as well-upholstered as the average tourist model, and as strongly constructed. The angle of the footboard and the raised

Rear view of the Rock sidecar.

Adjustable screen and apron £2 10s. and aluminium disc for wheel £2 extra.

Another model made by this firm is a tourist model, more or less on con-

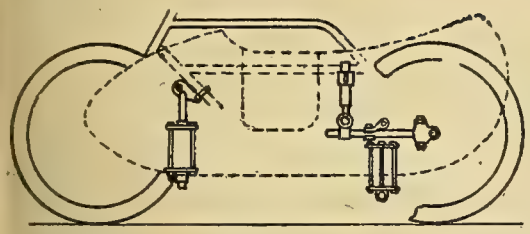
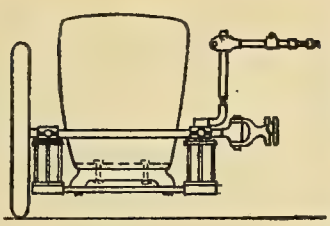
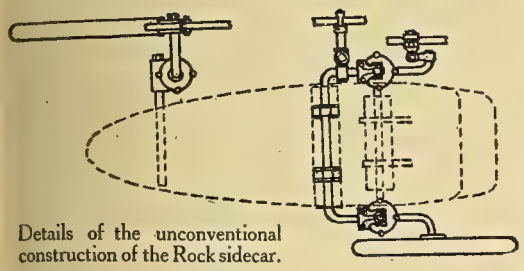
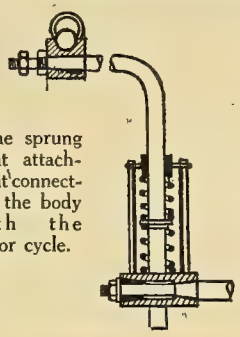
The Stanford "classic" semi-sporting sidecar.







Details of the unconventional construction of the Rock sidecar.



The sprung front attachment connecting the body with the motor cycle.

ventional lines—well-made and finished, and at a reasonable price, viz., £26 10s. Both these sidecars are also made in metal for overseas.

The Rock Sidecar.

In our issue for July 29th, we gave particulars of Australian produced motor cycles. Apropos the entrance of the Antipodes into the manufacturing field, we recently had a call from Mr. J. W. Underwood, managing director of the Underwood Patent Sidecar Pty., Ltd., of Melbourne, Australia. This gentleman gave us particulars of the Rock sidecar which embodies the company's patents. The chief features are in the design of the chassis and the springing, both of which are distinctly unconventional. The main weight of the sidecar at the rear is taken by a U-shaped steel bar attached flexibly to the chain stays at the top of the saddle tube, the body being bolted to a bar insulated from the U-shaped member by means either of coil springs or a transverse semi-elliptic spring, the front of the body being suspended in a similar fashion.

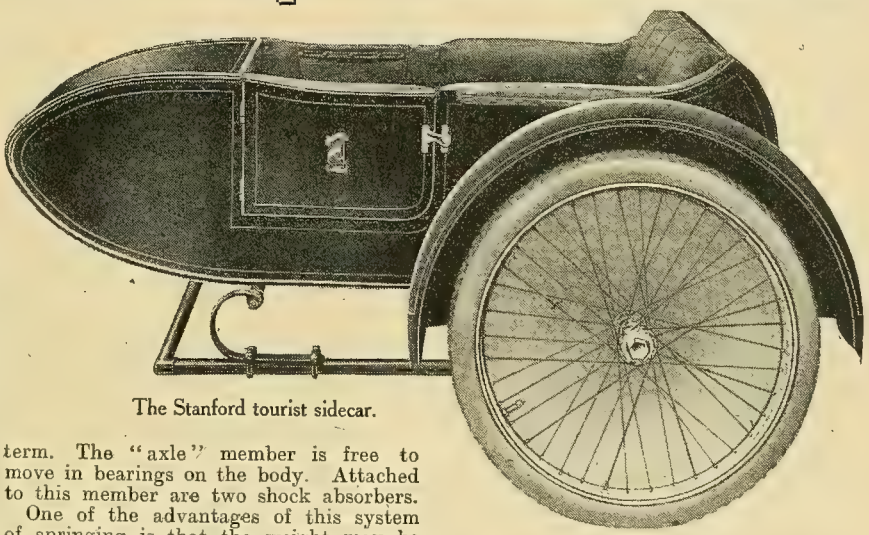
It may be said that the Rock sidecar has no frame in the usual sense of the term. The "axle" member is free to move in bearings on the body. Attached to this member are two shock absorbers.

One of the advantages of this system of springing is that the weight may be adjusted by slackening two bolts and nuts which shorten or increase the leverage on the arm. The total weight of the chassis is about 50 lb., and it can be attached either to a light machine or a heavy twin.

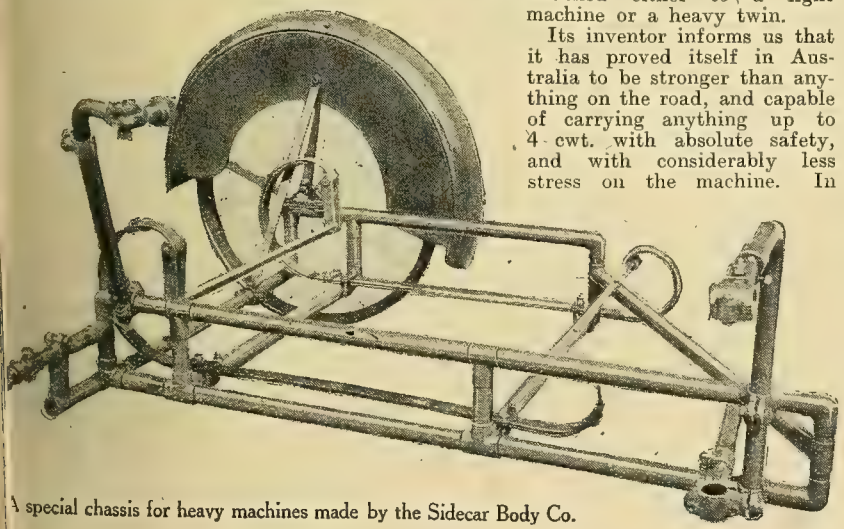
Its inventor informs us that it has proved itself in Australia to be stronger than anything on the road, and capable of carrying anything up to 4 cwt. with absolute safety, and with considerably less stress on the machine. In his design, Mr. Underwood has endeavoured to do away with rigidity as far as possible, to allow plenty of vertical movement with no horizontal movement. His firm has turned out as many as 1,000 sidecars per annum in Australia, and hopes very shortly to introduce the Rock on the English market.

Mr. Underwood's design certainly is not the first attempt to provide a non-rigid construction, but it appears to have greater possibilities than the majority of such devices we have inspected. We hope later to try the device.

Mr. Underwood's present address is 30, Dunsford Road, Bearwood Road, Bearwood, Birmingham.



The Stanford tourist sidecar.



A special chassis for heavy machines made by the Sidecar Body Co.

A Chassis for Four-cylinder Henderson Machines.

We recently inspected a sidecar chassis which has been specially constructed for attachment to Henderson motor cycles, and will shortly be placed on the market, equipped with a special body by the Sidecar Body Co., 23, Upper Clapton Road, London, E.5. Exceptionally sturdy construction and the capability to withstand the violent road shocks to which it is submitted when attached to a heavy four-cylinder machine are two of its principal features.

The chassis is made of 12 gauge steel tubing throughout, and the lugs are machined from the solid.

As clearly shown in the illustration, in addition to the three cross members, a diagonal tube, linking up the front ends of the twin longitudinal members, is introduced.

Four vertical supports bridge the off-side members, and of the four-joint attachment, the shape of the upper tube at the rear is such that easy access can be made to the left-hand kick-starter.

As the lower lug on the Henderson rear forks is not in line with the wheel axle, the lower sidecar lug is lowered in order to keep the chassis horizontal, and yet retain the alignment of the sidecar and motor cycle wheels. The body is suspended on a front and rear bracket, which latter are attached to two long C springs. A special two-seater body will also be fitted, the price of which will be in the vicinity of £35.

Taxation of Sidecars.

Thanks to pressure exerted by the Motor Legislation Committee through Sir W. Joynson-Hicks. The £4 sidecar tax has been amended. We forecasted this in last week's issue. The amendment provides that in cases where the cycle does not exceed 200 lb. in weight unladen the total duty will be £2 10s. only.

A.C.U. Six Days Trial.

The amount of hotel accommodation at Darlington is somewhat limited, and with a view to assisting the competitors, etc., the Darlington Bicycle and Motor Club are getting up a list of available beds. If any of the competitors wish any assistance in this direction, they should communicate with the hon. secretary, Mr. T. W. Watson, Central Chambers, Darlington.

In the Cumberland Trial.

At the conclusion of the recent Cumberland County M.C.C. Trial it was generally thought that the team of three Richardson cars was the only one to complete the course, but this supposition proved to be incorrect. The idea arose no doubt from the fact that these cars composed the only manufacturers' team to finish. The team prize was taken by the Worcester and District M.C.C., the riders in which were all mounted on Sunbeams.

Motor Cycle Enthusiasm at Newcastle.

There are now three motor clubs with headquarters at Newcastle-upon-Tyne. The aggregate membership of the three is well over 400. The Newcastle Motor Club, started in 1906, has been quiescent during and since the war, but was resuscitated at a meeting held recently, when an Advisory Committee was appointed to consider steps to revive the club.

At the present moment, the only club affiliated through the N.E.A.A. with the A.C.U. is the Newcastle and District M.C.C., which was started the same night in 1906 as the Newcastle Motor Club. The former club last month held a most successful trial for the White Cross Trophy, for which there were fifty-four competitors. It is one of the most progressive organisations in the North, having a paid up membership of over 200, the majority of whom are amateurs. The third Newcastle body, the Northern M.C., is of comparatively recent origin.

Next Year's T.T. Races—First Entries Received.

The Auto Cycle Union is already dealing with the preliminary organisation of next year's Tourist Trophy Races, to be held over the same course as was used this June. In this connection the Union makes the interesting announcement that the first entry for the 1921 Senior T.T. has already been received; this consists of three Norton motor cycles which the makers have put forward as a team in the 350 c.c. class. A Norton machine finished second in this year's Senior Race, and this make only missed winning the team prize by a matter of seconds, no team actually qualifying. It may be safely assumed that the present holders of the Tourist Trophies, the makers of the A.J.S. and Sunbeam motor cycles, will exercise their right to defend their titles to the Blue Ribands of the motor cycle world next year.

Special Features.

CAMPING WITH A LIGHTWEIGHT
AN UNTAPPED MARKET.
A.C.U. SIX DAYS ROUTES.

Lancashire Team Trial Results.

The North-Western Centre A.C.U. event resulted in a victory for the Warrington M.C.C. No. 2 Team, who thus secure the Blake Trophy and gold medals. Bury and District M.C. No. 3 Team secure second place and receive silver medals. In order, the placing of the other clubs is as follows: Bolton No. 1, Manchester No. 2, Bolton No. 2, Bury No. 2, E. Lancs., Warrington No. 1, Burnley No. 3, Bolton No. 3, J.B. (Liverpool) No. 1, J.B. (Liverpool) No. 2, N. Cheshire, Widnes, Burnley No. 2, Stalybridge, Manchester No. 3, Manchester No. 1, Burnley No. 1, and Bury No. 1.

SIX DAYS TRIAL IN THE FRENCH ALPS.
Competitors enjoying the view at Pont de la Goule Noire.

Surplus.

45,000 surplus military pedal cycles have been sold by the Government which may account for the falling off in demand for new bicycles which agents seem to think foreshadows a decline in the demand for lightweight motor cycles.

The White City.

The Executive of the "Great White City" announce the first of a series of exhibitions of national importance to be held at the Exhibition Buildings, Shepherd's Bush, during the winter months of this and succeeding years. A part of the car show will be held here this year.

The Ruling Body in Belgium.

Up to this year motor cycling in Belgium has been under the care of the Belgian Royal Automobile Club, but now the affairs and welfare of Belgian motor cyclists have been delegated to the Federation of Belgian Motor Cyclists by the R.A.C.B. The first active work of the new body was to attend the F.I.C.M. Conference in Paris on August 3rd, and then to meet the delegates of England and France. One of the most important items on the agenda was the settling of the international classification rules.

American Opinion.

Since America produced two spring frame machines, one of her motor cycle journals appears to think that U.S.A. has a monopoly in brains so far as spring frames are concerned. The following is culled from a recent paragraph: "Over in the land of Johnny Bull the riders are tortured with about 700 varieties of spring frame. Every British trade paper has photos of new types, each one worse than its predecessor. The one ambition of the designers seems to be to depart entirely from the conventional leaf springs which have proved so successful."

Second-hand Prices.

No appreciable change in the prices of second-hand machines has been apparent during the past few weeks, though the number of 1920 models coming into this market is steadily increasing. The list given below shows the highest and lowest prices asked by advertisers, and enables readers to keep in touch with current second-hand prices generally.

	Highest and Lowest.
A.B.C., 3 h.p., 4-speed, 1920	£132–£155
A.J.S., 6 h.p., sidecar, 1919-20	£175–£245

A Road Conference.

A conference to consider the development of roads throughout the Empire is being arranged by the Imperial Road Transport Council, to take place at Olympia from October 18th to 21st. The hon. secretary of the conference is Mr. Horace Wyatt, Imperial Transport Council, R.A.C., S.W.1.

Irish End-to-end Abandoned.

The Ulster Centre of the Motor Cycle Union of Ireland has definitely decided to abandon the End-to-end trial which was originally fixed for last month and postponed to a date in September. In substitution thereof it is proposed to hold an open two-day trial on September 8th and 9th, starting and finishing each day at Belfast. The first day's run will be through the Mourne Mountains in Co. Down, and the second day through the Co. Antrim, principally along the line of hills verging on the coast, with a special flexibility test at Iscar Hill, near Fair Head. It is hoped that a number of English entries will be attracted for this event.

Welsh Open Hill-climb.

The open hill-climb of the Welsh Eastern Group of Motor Cycling Clubs, to be held under A.C.U. open competition rules, will be held at Govilon Hill, near Abergavenny, on the 14th inst.

Ten open and five members classes comprise the programme, and awards will be made on time only, competitors being timed electrically. The classes are as follow: Class 1.—Scooters (open). Class 2.—Solo machines up to 275 c.c. (members'). Class 3.—Solo machines up to 275 c.c. (open). Class 4.—Solo machines up to 350 c.c. (members'). Class 5.—Solo machines up to 350 c.c. (open). Class 6.—Solo machines up to 500 c.c. (members'). Class 7.—Solo machines up to 500 c.c. (open). Class 8.—Solo machines up to 750 c.c. (members'). Class 9.—Solo machines up to 750 c.c. (open). Class 10.—Solo machines, unlimited (members'). Class 11. — Solo machines, unlimited (open). Class 12.—Sidecar machines to 500 c.c. (open). Class 13.—Sidecar machines to 750 c.c. (open). Class 14.—Passenger machines, unlimited (including three-wheel cycle cars) (open). Class 15.—Light cars up to 1,500 c.c. (open).

New Registration Index Letters.

In addition to the distingushing index letters D, KN, and KT, assigned to the County Council of Kent, KE has now been added. The letters XE, XF, and XH have also been assigned to the county of London. These make a total of twenty-seven different index marks for this district.

The Chatsworth Speed Trials.

The inter-club team event in the open speed trials at Chatsworth Park on Saturday next is arousing more than usual interest owing to the larger area thrown open to the competing clubs. The open classes are receiving the support of many well-known riders, G. Dance and other riders in this year's T.T. having entered. Being held at the end of a holiday week in a popular touring centre, the event will undoubtedly draw a large number of visitors. Club runs from the neighbouring towns are being arranged, and no admission fee is being made for entrance to the park. In the team event affiliated clubs from the counties of Derby, Leicester, Lincoln, Nottingham, and York are competing for the East Midland Centre Challenge Cup, which, for the clubman at least, will be the event of the day.

Lifting the sidecar wheel at speed—a demonstration of skill, nerve, and the strength of the machine. The Norton, with Henderson sidecar, depicted above, is driven by A. Fisher, of Sheffield, who was a D.R. during the war

A CAREFULLY DESIGNED TWO-STROKE.

Some Details of an Interesting Machine.

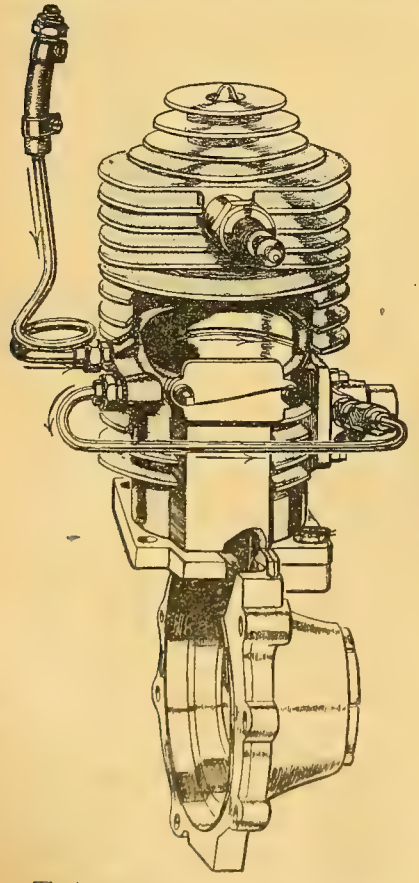
WE know of few motor cycles fitted with two-stroke engines in which more careful design has been incorporated than in the 2½ h.p. S. type Metro-Tyler. Unlike many two-stroke lightweights, the Metro-Tyler has been most carefully thought out in every detail. The machine was described in our issue for November 20th, 1919, but a few further remarks on its construction will not be out of place.

The engine and gear box are built up to form a single unit, the engine, magneto, and gear box being carried between two side plates, and entirely enclosed. The engine is naturally placed in front, next comes the magneto, and at the extreme rear the gear box. Both magneto and gear box are fastened in slotted holes so that movement is allowed for chain adjustment. The aluminium case, which encloses these three main parts, adds greatly to the appearance of the machine.

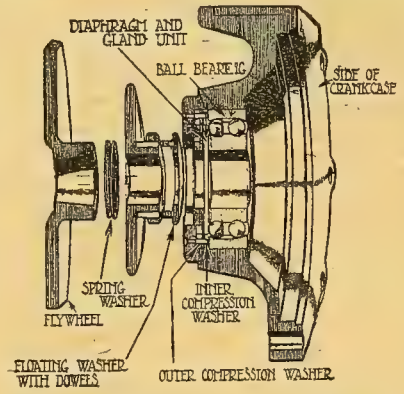
Two-speed Gear.

Of the ordinary two-speed dog clutch pattern, the gear box has a main shaft running on double ball bearings on the pulley side and single ball bearings on the chain side, while the lay-shaft runs on plain bearings.

To show how carefully details have been studied, we may mention that there is



The lubrication system. Arrows indicate the path of the oil.



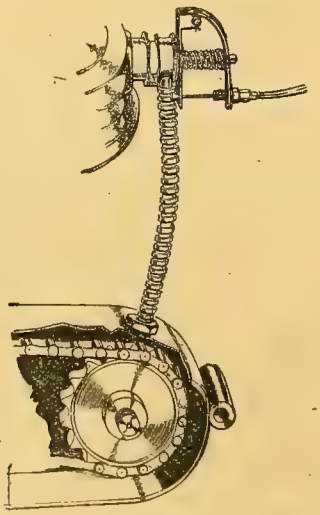
The compression retaining bearing and gland of the S type Metro-Tyler.

not a nut, on the machine but which is secured adequately, either by means of a spring washer, a split pin, or by wiring the nuts so that they cannot move.

By boring the cylinders right through to the head and by machining the exterior as well as the interior, a perfectly smooth finish is secured in order to assist cooling. Bolted to the head is a series of three aluminium cooling fins which assist in the radiation of the heat.

Crank Case Compression.

So far as internal parts of the engine are concerned it is worthy of note that a roller bearing connecting rod is fitted. Special care has been taken to render the main bearings compression tight, and this is effected by means of two fibre washers and a steel diaphragm pressing



A flexible pipe conveys the release gas to the chain case to lubricate the chain by oil vapour.

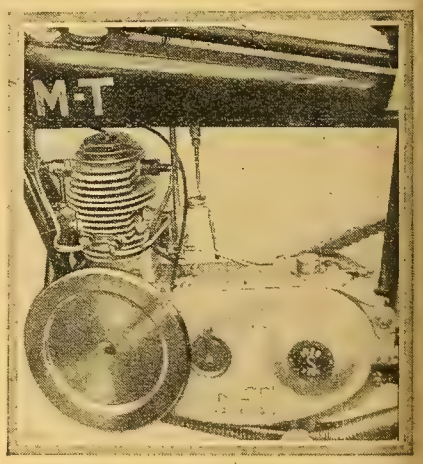
against a washer held by pins to the engine sprocket. By this means all danger of leakage is obviated.

Lubrication is effected through a drip feed provided with an auxiliary pump, the engine receiving the oil through crank case suction. There are two unions on the flywheel side of the engine. Through one the oil enters, and is carried *via* spiral grooves in the cylinder, out at the other union, and round to the induction pipe, through which it is drawn into the crank case, thus adequately lubricating the connecting rod and main bearings, the spiral grooves serving, of course, to keep the piston and gudgeon pin continuously supplied with oil.

Novel Exhaust Release.

It has been customary in the past in the design of some two-stroke engines to bring the gas from the release valve into the exhaust pipe, but in the case of the Metro-Tyler it is introduced into the unit cover so that oil spray from the cylinder is brought on to the magneto chain. Die castings are employed wherever possible, resulting in cheapness of manufacture and in an exceptionally neat and well finished appearance.

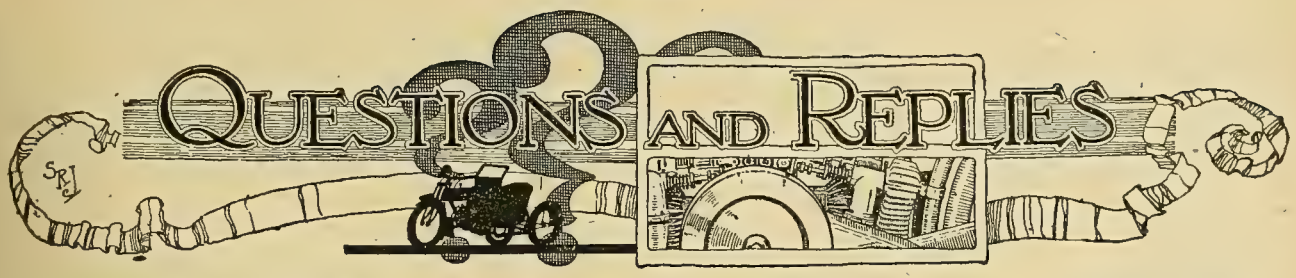
A point not often observed by motor cycle manufacturers is that of placing the date and type of the machine, and also



The Metro-Tyler method of enclosing crank case, magneto, and gear box.

the unit number, on the unit case, in a conspicuous position; so that the purchaser of a second-hand Metro-Tyler can make no mistake as to the date of manufacture.

The frame is also of great interest, as no lugs are used with the exception of the tank brackets, where brazing is employed, all joints being acetylene welded. All back members, namely, the back fork and chain stays, have exactly the same contour on each side, so that the manufacture of these is considerably simplified. The chain stays are bored with two holes, one of these taking the mudguard support, while the rearward holes take the spindle for the foot brake on one side and the silencer bracket on the other. The toolbag is of triangular shape at the rear of the carrier. It is of metal, and is fitted with a spring-held cover, while the rearmost side is of the correct dimensions and so serves as a number plate.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Fitting Large Tyres.

If there is no danger from skidding more easily or blowing off, should I be doing right in ordering 26in. × 2½in. or even 26in. × 2¾in. (if made) for my wheels which are made to take 26in. × 2¼in. covers? Will it be necessary to replace the inner tubes with larger at the same time?—C.O.F.

The largest tyre you can fit to the 26in. × 2¼in. rim is 26in. × 2½in. for 2¼in. A 26in. × 2¾in. cover will also fit satisfactorily, but an ordinary 26in. × 2½in. is unsuitable. Tubes of the same size as the covers are advisable.

Single-handed Control.

Will you kindly suggest the best way of altering the controls of a New Imperial-Jap with kick-starter and handle-bar clutch for a person with an artificial left-hand (from the wrist). I was thinking of putting the clutch on the right-hand side and making the gear change foot-operated. How can I make a pedal with stops for high, low, and neutral gears? Any suggestion will oblige.—R.C.H.

We would suggest that an easier alteration to make would be a foot control arrangement for the clutch operation. The gears could then be changed by the right hand, or you might even fix up foot operation for the exhaust valve lifter, and use this when changing gear.

Cork Clutch Trouble.

I shall be glad of your advice on the following: I have a 1914 twin Rex with three-speed gear and clutch of A.J.S. pattern. Should the corks be dressed? I cannot get my clutch to come out freely: I cannot get into low from free cleanly, but only with a deal of noise: the same applies to getting from low to second—from second to high is not so bad. Coming down seems all right. The wheels in the gear box are perfect. I am of opinion that this is due to the clutch, but I want your expert opinion before making a move, as I am not expert.—G.C.

Possibly the difficulty with the clutch is due to the operating cable having stretched, you should take up the adjustment provided. It would also be advisable to dismantle the clutch itself, and find out whether the clutch plates slide freely on the shaft, as they may be binding. The cork inserts do not require any dressing.

Limited Maximum Speed.

I shall be extremely obliged if you will kindly give me a little of your expert advice on the following matters: (1.) I have had considerable difficulty in starting my machine of late. The platinum points are slightly worn, but in spite of this there is practically always a good spark at the plug. I have taken the carburetter down, but cannot find anything wrong with it. Some time ago I got a spare jet (size 28) and closed it up slightly and put it in the carburetter, in place of the original 28 jet. The machine at that time (about January last) appeared to run just as well, so I have used that jet ever since. I have not at any time altered the float level. (2.) The machine appears to run quite well up to about 30 m.p.h., but I have noticed once or twice that above this speed it slows up. The machine will get up to 35 or 40 m.p.h. all right, but after running at this speed for about 100 yards or so, commences to slow up (and eventually starts knocking) as though it were going up a steep hill. After declutching and throttling down to about 15 or 20 m.p.h. it will go away as well as ever. The engine was decarbonised on 23rd May, and since then has done about 400 miles.—H.H.B.

From the symptoms you have described we should imagine that the mixture is on the weak side, due to your having closed up the orifice in the jet, and possibly also owing to a too low petrol level. We should recommend that you verify the petrol level (it should be $\frac{3}{32}$nds from the top of the jet when the carburetter is held in a level position). You might also carefully true up the platinum points of the contact breaker, and also replace your sparking plug by one with a large and substantial central electrode. Possibly your present plug electrode becomes semi-incandescent at high speeds, which would naturally cause pre-ignition and consequent knocking. A slight restriction of the jet orifice caused by dirt in the petrol would probably account for the trouble.

A Backfire.

My motor cycle is a 7-9 h.p. Indian with kick-starter in front of the engine on the left hand side. The kick-starter consists of a crank and chain wheel which works a sprocket wheel on the projecting engine-shaft. Quite recently I had the kick-starter repaired, and, in testing the first time, I was most fortunate in not having my left foot smashed. After priming the engine I gave the starter a good kick. The engine fired but worked in the opposite way to which it should, for it brought the kick-starter crank swiftly back and forcibly down, it striking the projecting engine sprocket, thus preventing it from revolving. The kick-starter chain then broke under the engine pressure. Had it not been for the engine sprocket preventing the starter crank from revolving my left foot would certainly have been smashed on the footboard by the terrific force of the starter crank. Would you kindly inform me why the engine worked in the contrary direction?—PUZZLED.

The reason your engine started in the opposite direction was because it backfired due to the magneto being timed too much in advance. If you have a variable magneto, retard it slightly when starting.

A fleet of Auto-gliders used in connection with a hospital collection in Birmingham.

An Old Engine.

I am experimenting to obtain the very best results from an old 5-6 h.p. twin Rex engine, and should be obliged if you would tell me the formula to get correct balance and smooth running.—S.M.W.

Generally speaking, you may take it for granted that the manufacturers have already balanced the reciprocating parts quite satisfactorily, and little, if any, improvement can be made in this direction, unless, of course, new pistons of different weight from the original ones have been fitted. "Motor Cycles and How to Manage Them" contains some useful hints and tips on tune and its maintenance, and also on many points which would be invaluable to you in connection with the work which you are at present undertaking.

A Dry Clutch.

I have a 2¾ h.p. New Imperial (1919) motor cycle, and would be pleased to have your advice on the following matter: Recently the clutch has been hard to operate, and squeaks slightly when in free engine position. It is a plate clutch with cork insets. Does it require oiling, and, if so, what kind of oil? I have read through the makers' booklet, but find no mention of oiling the clutch, so will be greatly obliged if you will answer this query.—C.H.C.

This type of clutch does not require oil, as it is designed to run in a dry condition. We should recommend you to dismantle it when you find that there is a slight binding occasioned in a portion of the clutch operating gear. You should experience no difficulty in taking it down or reassembling, as these clutches are quite simple.

Unbalanced Parts.

Having had a new piston and big and little end bushes fitted to my 3½ h.p. Arno, I find that at speeds about 15 m.p.h. (or coasting down a hill, or when just slowing down) the engine begins to bump badly. I can stop it for a time by lifting the exhaust valve a trifle; also I find that the big end bush is worn out after about 200 miles running. If you will advise me what to do I shall be greatly obliged.—A.C.

The fact that your new piston is heavier than the one originally fitted will throw the engine out of balance and cause vibration. It will be necessary to have your moving parts rebalanced. If you drive with your exhaust valve lifted slightly you will speedily have trouble, as both the valve and the seating will become badly burned. The big end bush was probably badly fitted, or the oil may be of unsuitable grade if the bush has worn out in 200 miles. We should recommend that you go to a reputable repairer and ask him to examine your engine, as there is undoubtedly something radically wrong with it. Without personal examination we are unable to give you any further help.

EXPERIENCES WANTED.

"J.C." (Manchester).—Any method of clearing celluloid windscreen which has become yellow through exposure.

"J.S." (Newcastle-on-Tyne). General opinions of four-cylinder Henderson.

IMPORTANT DATES.

Thurs., Aug. 5th, to Mon., Aug. 9th—
Anglo-Dutch Trial in Holland.

Sat., Aug. 7th—
East Midland Centre A.C.U. Open Speed Trials at Chatsworth Park.

Sat., Aug. 7th—
S.A.C.U. Inter-club Meet at Callander.

Wed., Aug. 18th—
South Wales Club's Open Speed Championship on Penchine Sands.

Mon., Aug. 23rd, to Sat., Aug. 28th—
A.C.U. Six Days Trial.

Sat., Sept. 4th—
Scottish Speed Championships at St. Andrews.

Scott Trial in Yorkshire.

Nov. 29th Dec. 4th—
Olympia Motor Cycle Show.

RECOMMENDED ROUTE.

CHELSEA TO SALCOMBE.—J.E.S.

Chelsea, Richmond, Kingston, Staines, Egham, Bagshot, Hartley Row, Hook, Basingstoke, Overton, Whitchurch, Andover, Salisbury, Wilton, Compton, Shaftesbury, East Stour, Sherborne, Yeovil, Ilminster, Chard, Yarcombe, Honiton, Exeter, Chudleigh, Newton Abbot, Totnes, Halwell, Kingsbridge, West Alvington, Marlborough, Salcombe.

Dick Turpin up to date. An official at a recent carnival at Hampstead uses his motor cycle to marshal the procession

A Tan Sad Stool.

The Tan Sad Works are now manufacturing an office stool on the lines of their well-known pillion seat. It should appeal to business men, shopkeepers, etc.

The Price of Platinum.

Jebron contacts have long been known to our readers as being practically indestructible and highly suitable for the contact breakers of magnetos. Mr. J. E. Brown, 36, Hermit Road, Plumstead, London, S.E., informs us that he is now able to reduce the price of his contact points, which will continue to be of the same quality as before.

New Enfield Repair Works.

Riders of Enfield motor cycles who live in London and the south will be glad to learn that the makers of these machines have acquired extensive repair shops at the rear of their showrooms (48, Holborn Viaduct, London, E.C.1). All classes of repairs will be dealt with, and the equipment is such that the staff are capable of handling forty overhauls a week.

A Production Record?

In some directions, at any rate, output is rapidly mounting up; for instance, in the last two weeks the production of O.K. Juniors has risen from 175 machines to 200, and even this figure does not reach the limit of the firm's productivity. Perhaps the comfortable and convenient equipment and the pleasant situation of Messrs. Humphries and Dawes model works at Hall Green on the borders of Birmingham has much to do with the happy state of the workpeople, whose efforts achieved this splendid result.

An Interesting Catalogue.

A very pleasant half hour may be spent in perusing the 1920 catalogue which is now obtainable from Messrs. Brown Brothers, Ltd., Great Eastern Street, London, E.C.2. It contains illustrations and prices of almost everything which the motorist or motor cyclist is likely to require, and includes not only accessories for the machine but component parts, such as frames, and also fittings and tools for the workshop. The miniature edition of this catalogue will be sent free to readers who apply for it.

Service Depots for Scott Riders.

A useful little booklet has just been issued by the Scott Motor Cycle Co., Ltd., which contains a list of Scott agents throughout the British Isles. At all these depots Scott owners on tour will be able to obtain spares and repair service. A map is included on which the names of all towns having these special agents are underlined in red. This is a scheme which other manufacturers might well adopt, as it is decidedly helpful to the rider who is away from home and in need of some essential spare.

GODFREY'S LTD.

CAN SUPPLY FROM STOCK THE FOLLOWING NEW MACHINES:

½ h.p. **ALLON**, 2-stroke, 2-speed, clutch, and kick-starter	£85 0
3½ h.p. **ARIEL**, countershaft 3-speed gear, kick-starter, and coachbuilt Sidecar	£152 10
6-7 h.p. **ARIEL**, countershaft 3-speed gear, kick-starter, chain drive	£145 0
2¾ h.p. **BLACKBURNE**, 2-speed, clutch, and kick-starter, chain drive	—
4 h.p. **BLACKBURNE**, 3-speed, clutch, and kick-starter, chain drive	£135 0
8 h.p. **BLACKBURNE**, 3-speed, clutch and kick-starter	£180 0
8 h.p. **BLACKBURNE** Sidecar Combination, 3-speed, clutch, and kick-starter, detachable wheels, chain drive, spare wheel	—
6-7 h.p. **B.S.A.**, Model A, 3-speed countershaft gear, chain drive	£150 0
2¾ h.p. **CALTHORPE**, J.A.P. engine, 2-speed	£78 5 6
2¾ h.p. **CALTHORPE**, 2-stroke, 2-speed	£74 19 6
2¼ h.p. **CEDOS**, 2-stroke, 2-speed	£73 10
2¼ h.p. **COVENTRY-EAGLE**, 2-stroke, single-speed	£72 9
2½ h.p. **COVENTRY-EAGLE**, 2-stroke, 2-speed, and kick-starter	£84 0
3½ h.p. **COVENTRY-EAGLE**, Sturmey-Archer 3-speed gear	£117 12
2¾ h.p. **COVENTRY-EAGLE**, J.A.P., 2-speed, clutch, and kick-starter	£90 6
2¼ h.p. **CLYNO**, lightweight, 2-stroke, 2-speed	£75 0
2¾ h.p. **DIAMOND-J.A.P.**, Enfield 2-speed gear	—
2½ h.p. **DIAMOND**, 2-stroke, single-speed	£62 3
2½ h.p. **DIAMOND**, 2-stroke, 2-speed	£81 3
2½ h.p. **IMPERIAL-J.A.P.**, 2-speed, clutch, and kick-starter	£89 5
2¾ h.p. **INVICTA-J.A.P.**, 2-speed	£89 5
2¼ h.p. **INVICTA**, 2-stroke, single-speed	£71 8
2½ h.p. **INVICTA**, 2-stroke, 2-speed	£84 0
3½ h.p. **INVICTA**, countershaft, 3-speed model	£117 12
3½ h.p. **LEA-FRANCIS**, 2-speed	£130 0
2½ h.p. **LEVIS**, Popular, 2-stroke	£60 0
2¾ h.p. **O.K.-UNION**	£50 8
3½ h.p. **RUDGE-MULTI**, T.T. model	£110 5
3½ h.p. **SCOTT**, 2-stroke, 2-speed	£140 0
3½ h.p. **SCOTT** 2-stroke 2-speed Sidecar Combination	£185 0
2½ h.p. Junior **TRIUMPH**, 2-stroke, 2-speed	£75 0
2¾ h.p. **WOOLER**, twin engine, variable gear	£102 0
4-5 h.p. **ZENITH**, Model C, twin-cylinder, Gradua gear	£123 0

EARLY DELIVERY CAN BE GIVEN OF:

3 h.p. **A.B.C.**, 2-cyl., horizontal, 4-speed, countershaft gear, spring frame	£150 0
2½ h.p. **IMPERIAL-J.A.P.**, 2-speed	£80 17
8 h.p. **IMPERIAL**, twin cylinder, J.A.P. engine, countershaft 3-speed gear, kick-starter	£147 0
8 h.p. **IMPERIAL**, as above, with coachbuilt Sidecar	£186 18
6 h.p. **IMPERIAL**, twin cylinder, J.A.P. engine, countershaft 3 speed gear, kick-starter	£147 0
7 h.p. **INDIAN** Powerplus, twin engine, cradle spring frame, kick-starter, 3-speed, with electrical equipment, and speedometer	£181 14
7 h.p. **INDIAN**, Powerplus, as above, with Indian coachbuilt Sidecar	£223 14
4 h.p. **INDIAN** (Scout), twin engine, rigid frame, 3-speed kick-starter, and clutch	£140 0
4 h.p. **INDIAN** (Scout), as above, with Indian coachbuilt Sidecar	£180 0
8 h.p. **MATCHLESS** Combination, Model H, J.A.P. engine, spring forks, countershaft 3-speed gear, silent chain drive, patent quick detachable wheels, including spare wheel, 3in. tyres on all four wheels, kick-starter	£205 0
6 h.p. **MARTINSYDE-NEWMAN** Combination, twin engine	£170 0
2¾ h.p. **N.U.T.**, twin engine, with Lucas Magdo lighting Set	£165 0
5-6 h.p. **RUDGE MULTI**	£120 15
7-9 h.p. **RUDGE MULTWIN**	£147 0
RUDGE Sidecar	£42 0

Choose the Tread that Suits the Roads you Ride on.

NO matter what roads you ride on, whether sandy, gravelly, or "clayey," you can get

Bates

MOTOR CYCLE TYRES

with just the right tread to suit them.

For Sandy or Flinty Roads—

You need a good plain tread, to withstand sharp edges without the necessity for very much "grip."

BATES NO. 1 PATTERN

gives you all the grip you need with a saving of friction which considerably lengthens the life of your tyre. The side ridges prevent skids when "cornering."

For Greasy or "Clayey" Roads—

A tread that will bite into the road without skidding or "forward-slipping" when climbing hills.

BATES NO. 2 PATTERN

gets a grip on the greasiest road with no undue friction or wear on the tread.

For Heavy Combinations—

A tread that will give you the additional "grip" required and yet withstand the extra wear and tear.

BATES ALL-WEATHERS PATTERN.

Made in 650 × 65, 3in., for 650 × 65, 26 × 3, and 700 × 80.

Send for Interesting Booklet.

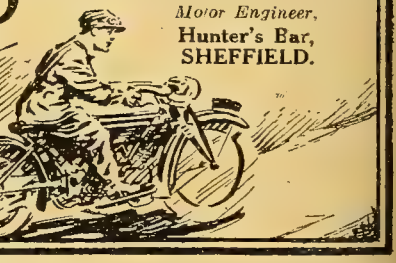
Hunter's Bar, SHEFFIELD.



SAPON SOAP

Rapidly Removes GRAPHITE GREASE in Cold Water.

Hundreds of motor engineers use SAPON SOAP, because experience has taught them that there is no other soap on the market to compare with it for removing **graphite grease.**

No matter what the water is like, hot or cold, hard or soft, SAPON SOAP quickly removes every suspicion of grease or oil.

It is not a frictional cleaner, but converts the grease into lather.

Russian Tar, "Ideal" toilet, or any other Sapon Soap is equally suitable for the use of motor engineers. Always keep some in the Garage or the Works.

6d. per tablet.

A perfect Skin-healing Soap.

Can be obtained from all the leading chemists and stores or any of the 620 branches of Boots Ltd., or direct from the Makers,

ORDER TO-DAY.

GRADO LTD., Pershore St., BIRMINGHAM.

for Real Riding Comfort and Sturdy Simplicity

A frame that's sprung like a car, with long cantilever leaf springs that give buoyant insulation from the road and absolute lateral rigidity—so comfortable that even the man who's "not so young as he used to be" can ride all day without fatigue or distress.

A powerful no-trouble well-balanced two-stroke engine giving steady even pull, lack of vibration, and smooth rapid acceleration, with a system of automatic lubrication at all engine speeds which can't go wrong.

A simple two-speed gear that takes up the drive and gives speed transition so gently as to be imperceptible.

Two powerful brakes, one foot operated and acting upon a brake drum of large diameter fixed to the countershaft, and the other, hand-operated, acting similarly on the front wheel—either of which will stop the machine.

A smart, business-like all-weather all-black finish, and neat appearance, due to the absence of redundant struts and dirt-collecting corners.

A stream-line two gallon fuel tank, which with the wide mudguards forms an integral part of the frame.

Ample mudguarding for machine and rider.

The neat arrangement of all controls (including change speed lever) on the handle-bars.

These are a few of the features which make the Beardmore-Precision a machine for utility—for business or for pleasure.

Beardmore-Precision

DESIGNED AND BUILT THROUGHOUT AT THE PRECISION WORKS, KINGS NORTON, BIRMINGHAM.

THE MOTOR CYCLE ROUTE BOOK

With Road Maps of England & Wales, Scotland, and the London District

A WELCOME departure from the stereotyped form of road book is made in "THE MOTOR CYCLE" ROUTE BOOK. In addition to the usual routes from London, radiating main routes are given from other large and populous centres in England and Wales, and Scotland, as well as "linking-up" routes from all other cities and towns of fair size. The intersecting or linking-up routes are clearly shown by reference numbers. The items of interest on the main roads are described by the well-known authority on roads, Mr. Chas. G. Harper. A useful set of Maps of England Wales, and Scotland, in Atlas form, and printed in red and black, is included.

List of Contents

Radiating Routes from Large and Populous Towns, Traffic-avoiding Routes, and Routes into and out of London.

Linking-up Routes from and to smaller Towns.

List of Ferries in England, Wales, and Scotland, with their charges.

List of Speed Limits in Various Counties.

Lighting up Time Table.

Also 32-page MAP SECTION.

Price 5/- net. By Post, 5/6.

Obtainable from ILIFFE & SONS LTD., 20, TUDOR STREET, LONDON, E.C.4

Fit your A.M.A.C., B. & B., Senspray, or Triumph Carburetter with a

W.S.R. Patent Variable Jet Adapter.

WHAT IT DOES.

Gives You More Power—Higher Speed—Slow Running—Easy Starting—Cooler Engine—More Mileage per Gallon—Greater Vaporisation. Petrol emerging in Circular Spray.

Fitted in one minute to above-named carburetters—simply unscrew plug holding jet and screw in the jet adapter.

This jet can be varied while running, giving a large jet for stiff hills down to a small one for ordinary running. No stopping to take out jet to clear obstruction—the W.S.R. can be cleared while machine is in motion.

State make of Engine, Carburetter, and length of jet (including plug) when ordering. For Triumph state dia. of thread across base plug, and date of carburetter.

YOU CAN STICK

a pair of Ustikon Solepieces to your shoes as easy as you can stick a stamp on your letters. No tools are required, neither screws nor rivets. The method is simplicity itself. What can be easier?

Though marketed recently, these solepieces are worn now habitually by *men, women,* and *children* all over the country.

This quick, wide demand for a new product can be explained only by the tremendous *need* for it. These solepieces resist slipping, thus making walking safe. They are flexible and easy to the feet of men and women, and permit proper growth to younger feet.

Surely in these days of high prices Ustikon Solepieces are worth consideration. You save money on every shoe so repaired and get double the wear at half the cost. Once you have fitted you will readily appreciate the economy.

DAVIS' Ustikon SOLEPIECES

GENTS', Sizes 5-8 ..... 3/-
LADIES', Sizes 2-3 ..... 2/-

THE MOTOR CYCLE

Insurance • Policy •

This space will be occupied week by week with copies of actual letters received from Policy holders who have had occasion to make claims. Full names and addresses will be supplied to any bona-fide enquirers.

Gentlemen,

I beg to acknowledge receipt of your favour of the 10th inst., and to express to you my sincere thanks for the very prompt and satisfactory settlement effected by you of the claim against me in respect of recent accident. I shall have much pleasure in recommending your Company to my motor-cycling friends.

Regretting that you should have had to meet a claim on a Policy so recently issued, and again thanking you for your attention,

Yours faithfully,

The only SAFE TEST of insurance is

CLAIMS.

Branches: BIRMINGHAM—Guildhall Buildings, Navigation St. MANCHESTER—199, Deansgate. LEEDS—Calvert's Chambers, 8, Commercial St. NEWCASTLE—Atlas Chambers, Westgate Rd. CARDIFF—15, High St. GLASGOW—137, West Regent St.

MOTOR CYCLES FOR SALE.

New Imperial.

2½h.p. 1920 New Imperials, No. 1 and No. 2 models from stock; No. 1, without kick starter and clutch, 2 speeds only, £80/17; clutch model, with kick starter, 2-speed gear, £89.—Wauchope's, 9, Shoe Lane, London. [9272

ALLEN-BENNETT Motor Co.—1919 New Imperial-Jap 8h.p. combination, all lamps, horn, splendid condition throughout; £145, or half down and 12 monthly instalments.—9-10-11, Royal Parade, West Croydon. 'Phone: Croydon 2450. [9380

NEW IMPERIAL-J.A.P. 8h.p. Combination, 1919 W.D., F.R.S. Major head lamp, side and tail, Canoelet sidecar with rear locker, Klaxon horn, Easting wind screen, perfect mechanical order; by appointment evenings after 7.30.—Barley, 29, Langley Drive, Wanstead. 'Phone: City 2374. Price £145. [8821

Norton.

T.T. Norton, 1920, run 100 miles, flier; best over £108.—213, Alcester Rd., Moseley, Birmingham. [X7809

1913 3½h.p. T.T. Norton, adjustable pulley, Sen-spray, Stewart horn, new back tyre, recently overhauled; nearest £50.—Capper, Trent, South St., Faversham. [9115

NORTON, B.R.S., Sept., 1919, 2-speed, also single gear pulley, tyres good, rebushed; £117/10.—Morton, Topsham Barracks, Exeter. Owner going abroad. [9028

N.U.T.

N.U.T. Motor Cycles from Stock.—A. J. Young and Co., Ltd., Heath Garage, Newmarket ('Phone: 214). [0009

N.U.T., 1920, Lucas dynamo lighting set, latest model, just delivered; list price.—King, Rendella, Oxford Rd., Birkdale, Southport. [9204

N.U.T., 1920, fitted with Magdyno lighting; immediate delivery from stock at list price, £165.—Elce and Co., 15-16, Bishopsgate Av., Camomile St., E.C.3. [0066

N.U.T., 3½h.p. twin J.A.P., a real fast and sporty machine, good condition throughout, tyres good, with lamps; first £58.—Pratt, Burton Leonard, Harrogate. [X7589

N.U.T.—We are sole wholesale and retail agents for Staffordshire, and can supply these famous machines for early delivery.—Walsall Garage, Walsall. Tel.: 444. [5766

W. SPARROW, Ltd., Osborne Garage, Yeovil, official N.U.T. agents, now booking orders for early delivery. Write or 'phone for particulars—Tel.: Yeovil 114. [6023

1920 (July) N.U.T., Lucas dynamo lighting, unscratched; first cheque £155 secures; owner going abroad. — Hughes, Abbey House, Cobridge, Stoke-on-Trent. [9015

N.U.T. 3½h.p. Twin, lamps, knee-grips, Klaxon, Tan-Sad, many spares, in splendid condition, and very fast, one of last o.h.v. models made; nearest £100.—Fielden, Bracknell, Berks. [8917

N.U.T. 5-6h.p. J.A.P., S.A., 3-speed, clutch, lamps, speedometer, complete; £85.—Bickell and Sons, Garage and Motor-Engineers, 247-251, Archway Rd., Highgate, N.6. 'Phone: Hornsey 1090. [0255

O.K.

O.K. 4-stroke, 2 speeds, perfect order, like new; £35.—Hichens, The Club, St. Ives, Cornwall. [8779

2¼h.p. O.K. Junior, 4-stroke, 2-speed; £35, or near offer.—Elliott, Ivy Cotage, Rookham, Surrey. [8650

O.K. Union Motor Cycle, Villiers, C.A.V., Amac, brand new; £50.—Pearce, Woodman St., Cirencester. (D) [9109

O.K. 2¾h.p., 2-speed C.S. gear, in very good order, lamps, and horn; £42.—H. Williams, High St., Eccleshall, Staffs. [X7806

O.K. Union, instant deliveries from stock; 48 gns.—Hewin's Garages, Ltd., the Real Service Firm, Taunton and Tōtnes. [9151

O.K. Junior, 1915, 4-stroke, 2-speed, o.h.i.v., new carburetter, very good condition; 40 gns.—19, High St., Whitechapel, E.1. [9088

O.K. Junior, the 48 gn. marvel.—Early deliveries from the Birmingham agents, Frank Whitworth, Ltd., 139, New St., Birmingham. [X7567

O.K. Juniors from Stock; 48 gns.—A. J. Young and Co., Ltd., Heath Garage, Newmarket ('Phone: 214), and 75, Albany St., Regent's Park, N.W.1 ('Phone: Museum 5476). [4010

ALLEN-BENNETT Motor Co.—O.K.-Villiers, single speed, brand new; £50/8, or half down and 12 monthly instalments.—9-10-11, Royal Parade, West Croydon. 'Phone: Croydon 2450. [9360

O.K.-J.A.P., about 1915, 4-stroke, 2-speed, T.T. bars, spare belt, lamp and horn, etc., full insurance just overhauled; 36 gns., or near offer.—A. J. Hammant, 8, Greys Rd., Henley-on-Thames. [8691

ALLEN-BENNETT Motor Co.—O.K.-Villiers, 2-speed best value for money, brand new; £65, or half down and 12 monthly instalments.—9-10-11, Royal Parade, West Croydon. 'Phone: Croydon 2450. [9359

P. and M.

LARGE Number of P. and M., 1917 and 1918 3½h.p., 2-speed gear, kick starter, all-chain drive, semi-T.T. bars, W.D. models, overhauled, perfect condition, makers' colours, ready to ride anywhere; real bargain, £70. The trade supplied. — Barnett, of Norris and Hall, Engineers, Ridge Mews, Child's Hill, Cricklewood, N.W.2. 'Phone: Hampstead 7667. [8561

Performance and Price.

THE present-day big reliability trials are run with little regard to the comparative values of competing machines. The attitude of judges and the public generally is that of letting the best machine win, and perhaps insufficient attention is paid to the relative cost of the various machines matched against each other.

Obviously, if two machines are entered side by side and secure "golds" in, say, the English Six Days, the inference is that they are of equal merit, and the public may think no more of the matter so long as the system of judging takes no account of the comparative price of those two machines. If, however, we learn that the manufacturer of the "A" machine sells his product for £110, while the maker of the "B" asks £150, there is a strong temptation to regard the former as a more meritorious performance, inasmuch that the machine is one appealing to a wider circle and is evidently produced with an eye on that greater public on the patronage of which depends the future of the motor cycle movement.

In the present stage of mechanical development, there is no reason at all why a machine cannot be built (regardless of price) successfully to negotiate anything a trials committee cares to organise; to build a motor cycle at a moderate price with the same powers of performance is a problem tied up with future progress.

It would seem that, as the A.C.U. has already done much to raise the technical standard of the annual Six Days Trials, it might well extend its purview to this essentially technical matter of cost. Many makers of the cheaper lightweights are deterred from entering such events by the consideration that their machines will be compared, in the public eye at any rate, with machines costing twice as much; and they feel that their performances, on a comparative basis, are somewhat overshadowed.

Of course, it may be argued that the ruling body would be exceeding its scope if it placed any embargo on the maximum price of machines or awarded marks according to their varying cost; a price ruling would also have an effect on design which might tend towards crudity. This, however, should not carry much weight, as at the present time all machines must conform more or less to certain main lines of specification already laid down and generally accepted.

Two-stroke Development.

ALTHOUGH the two-stroke principle is of about the same age as the Otto cycle, its progress in the motor cycle world is of comparatively recent growth. After ten years' four-stroke development, the Scott engine more or less burst upon the public as a revelation, but it was not until some time later that the Levis and Connaught air-cooled engines showed the latent possibilities of the type; indeed, it may be said that these were the forerunners of a new trend of design.

Latter-day progress has accepted the air-cooled two-stroke as a type well worthy of the concentration of much designing ability and manufacturing organisaton. The result of this effort is now beginning to show itself. A two-stroke engine has propelled a machine round the T.T. course of 188 miles at an average speed of 38.1 m.p.h.; another has made twenty-five consecutive non-stop climbs of the famous Old Wyche at Malvern (one of the steepest test hills in Great Britain); whilst the latest reports tell us of yet another machine of the same type which has averaged 41.71 m.p.h. for twelve hours on Brooklands, thus creating new records, and, incidentally, being the first two-stroke to achieve a success of this nature.

All these performances have been accomplished on air-cooled engines of less than 350 c.c. capacity; and, in view of such results, there can be no doubt that this type of engine is now fully entering into its own.

An index to the advertisements in this issue will be found on the page facing the back cover.

A Knee Apron.

I FIND I was in error in stating that nobody has marketed an apron designed to stretch back practically horizontally from the steering head and protect the rider's knees in rainy weather. Such a fitting has long been an optional extra on the College legshield. Its fore edge is secured to the vertical shield, and its rear edge is hooked to the rider's coat or belt when he is mounted, and also serves to keep the saddle dry when the owner dismounts in wet weather.

The New Claudel Carburetter.

ALTOGETHER I have owned three Claudel-Hobson carburetters on motor cycle engines, and have been uniformly enamoured with the simple control and gee-whizz acceleration which they afford. The latest pattern is adorned with a stub lever about an inch long, inscribed with three arrows pointing in divers directions, and distinguished by the respective legends, "Start," "Run," and "Weak." I have not yet had time to dismantle the gadget and investigate its innards; I dislike stripping strange carburetters without a drawing, ever since I tore the jet of a hush-hush carburetter in half on a lonely moor by such an error in tactics. But this stub lever appears to be the goods. It gives a push start in one yard from cold on current petrol. When started, the engine sulks till you shift the lever to "Run." Should you accidentally move it too far with a clumsy gloved hand, so that it reaches the "Weak" position, you will get a pop-back for sure. This is a move in the right direction. Too many designers provide the same mixture for starting with a cold engine, and for running a hot engine slowly. Which is absurd.

Motor Bicycle v. Railway.

THE other week a correspondent gave the running expenses of a motor bicycle at 2.6d. per mile as contrasted with 3d. a mile on the railway. There is surely more in it than these figures suggest. In the days when railways were railways, I accompanied an End-to-end aspirant, a follower or two, and several motor bicycles per train from London to Wick. The Parliamentary penny per mile was the least considerable item of our expenses. There was getting to the London terminus—with our baggage. There was light literature to beguile the tedium of the train—one omnivorous brain merchant in the party almost cleared a bookstall. There was tobacco. Baskets of food. Visits to the restaurant car. Tips to various officials. Finally, our lightened pockets shovelled out the last of their small change at Wick. By contrast, a motor cycle takes you from door to door. You cannot read in the saddle. You cannot smoke; you light a pipe when you start up, the first mile burns up the baccy by forced draught, and you chew the cool mouthpiece on the cheap till the next stop. There is nobody to tip. Surely, the incidental expenses of railway travel are far heavier than those of motor cycling? I am never so extravagant on a petty scale as when my evil angel compels me to put in a long day on the train.

A Peculiar Trouble.

WHEN a motor cycle is in a waggish mood, it can be almost as whimsical as a woman, and I have just heard of a particularly elfish machine, which puzzled an experienced rider for days. The engine was in perfect mechanical order, the ignition was superb, the jet was in action on aviation spirit, all controls were operating, and yet the behaviour of the machine was eccentric to a degree. Sometimes the engine would start at the first kick; sometimes it took nearly an hour to get it going when its reluctance would suddenly cease without apparent rhyme or reason. Once started, its subsequent behaviour was equally erratic. One day it would be as obedient as de la Hay's Sunbeam when supertuned for a stunt. Then without warning it would go completely crazy, slow down when it should have accelerated, accelerated when it should have slowed down, or even stop altogether and refuse to restart. Occasionally a fit of misfiring would intervene, and continue for various periods. These symptoms became a regular nightmare. The solution was ridiculously simple at the finish, and I will publish it in our next issue after amateur physicians have had time to prepare a diagnosis.

Riders as Designers.

IF the publicity manager of any firm is seeking for a new way of spending money, he might do worse than offer a set of prizes for the best suggestions from his customers for improving the machine which it is his business to push. Concerns differ enormously in the fashion in which they accept criticism and ideas. A letter before me tells how the writer forwarded a list of desirable improvements to his maker, and received in reply a letter reminiscent of those which Government Departments are such adepts in composing; it might be paraphrased as "our experts know all about everything." At the next Olympia, the firm in question printed eight new talking points on their folders, and five of them coincided with my correspondent's suggestions. Here and there one meets a firm which is positively dishonest. A friend of mine put about 8 m.p.h. on to his T.T. model some years ago by a gadget which was not patentable. He disclosed it to the makers under pledge of secrecy, was thoroughly pooh-poohed, and found the gadget on their next season's model in due course. Personally, I have been more fortunate. When any of my suggestions have been sound, they have often been adopted. A customers' suggestion competition would be money well spent.

"ROADS" TO BE ENCOUNTERED IN THE 1920 SIX DAYS TRIAL.

A.C.U. Six Days Event in the North-eastern Counties. Monday, Aug. 23rd, to Saturday, Aug. 28th.

(Top) A scene on Stake Fell. This road will be traversed on Tuesday afternoon.

(Bottom) Near Semmerwater—a typical stretch of road in Wensleydale. This district will be touched on Monday, Tuesday, and Friday.

THERE are over 120 entries in the most important reliability trial of 1920, and many innovations in the running of the event will be made.

Much of the country to be covered is unfamiliar to the habitual trials-rider, and some very sporting hills are included. The last two days involve a run from Darlington to the South of England, for a final speed test on Brooklands.

A full list of entries, maps of the routes, and timetable appeared in our last week's issue.

M. Jules Neher, chairman of the F.I.C.M. meeting held in Paris last week. He is managing director of the Motosacoche Co., Geneva.

INTERNATIONAL SIX DAYS TO BE IN SWITZERLAND NEXT YEAR.

Representatives of the World's Motor Cyclists meet in Paris. Important Decisions. Short Distance Records to be the mean of Two Runs in Opposite Directions.

AN international Six Days Trial in Switzerland is to be held in August next year. This was decided at the congress of the International Federation of Motor Cycle Clubs held last week in Paris. Another important decision was that from January 1st next year certain short distance records shall be the mean of two runs in opposite directions.

The International Federation of Motor Cycle Clubs exists for the purpose not only of organising competitions, but for making rules governing these competitions and attempts at record, so that all motor cycle events in countries belonging to the Federation may be properly run and all records claimed correctly established.

At the present moment most European countries are represented on the F.I.C.M., and these are Great Britain, France, Holland, Italy, Belgium, Switzerland, the United States, Norway, and Sweden. The last two countries joined at the meeting held in Paris on the 3rd inst. All the national motor cycle clubs must be recognised by the leading national automobile club. Now, motor cyclists are probably more active in Spain than in many other European countries, but owing to the failure of Spanish motor cyclists to establish a truly representative motor cycle club or union recognised by the Royal Automobile Club of Spain, the joining of that country to the Federation is still in abeyance.

The Next International Trial in Switzerland

An important decision come to at the meeting was that of holding the 1921 International Six Days Trial in Switzerland. No happier choice could have been made, as Switzerland is the playground of Europe: it provides ample opportunities for testing the machines to an extent quite impossible in this country. British manufacturers will get the fullest possible benefits from entering owing to the number and various nationalities visiting the country, and the event will be organised by that most active and efficient body, the Swiss Motor Cycle Union. The trial is to take place during the first fortnight of August.

The proceedings opened at 10.30 in the morning, when a sub-committee met to revise the classification rules. Several important alterations were made, which, of course, will be adopted by the Auto Cycle Union, and new rules were drawn up governing the recognition of records.

There were present M. Jules Neher (president of the Swiss Motor Cycle Union) in the chair, Messrs. Graeme Fenton (France), G. A. de Ro (Belgium), E. M. P. Boileau (Great Britain) (by special invitation), and T. W. Loughborough (secretary of the F.I.C.M.).

Various suggestions were made by the different countries interested. Belgium, for instance, aimed at abolishing the 250 c.c. class, and grouping all machines up to 350 c.c. in Class 1, making Class 2 up to 600 c.c., and Class 3 up to 1,000 c.c.

France was content to leave things as at present, but a valuable idea, which was finally adopted, emanated from Switzerland as regards silencers. So far as Great Britain was concerned the A.C.U. put forward numerous suggested alterations. Among these it was proposed that the rule stating that in Division 2 (motor bicycles with sidecars), all vehicles must be fitted with a clutch or other free engine device.

Division 3.—Cycle cars with clutch or other free engine device and change speed gears should be abolished. As it was thought that since it was obvious that at this stage of the motor cycle industry these fittings were indispensable, the rules were, therefore, unnecessary. When, however, the matter came before the sub-committee, it was at once pointed out that if freak vehicles are to be eliminated the rules must stand: as in France the absence of these regulations would result in the entering of monstrosities designed only for special events.

This shows how necessary it is that such regulations should be drawn up so as to suit all countries, and gives an idea of the work carried out by the F.I.C.M. So far as the rules governing the classification of motor cycles in open competitions are concerned, the following are the principal alterations, the first of which comes under the definition of a motor bicycle. It now reads:

"A motor bicycle is defined as a vehicle comprising a frame, two wheels, and a suitable engine. Motor vehicles with more than two wheels, and weighing, without oil, fuel, or water, less than 350 kilos., are included in the term 'motor cycle.' Thus the weight is increased by fifty kilos = 100.2 lb."

Considerable alterations have been made so far as the classes are concerned as regards minimum weights and size of tyres.

DIVISION I.—MOTOR BICYCLES.

Class	C C	Min. Weight, without Oil or Fuel, in Kilos		Min. Size of Tyres. Cover and Tube Separate and Detachable.	
		Now.	Formerly.	Now.	Formerly.
				mm.	mm.
A.	250	60	40	50	45
B.	350	75	50	55	50
C.	500	85	60	60	55
D.	750	100	70	65	60
E.	1,000	120	80	75	65

DIVISION II.—MOTOR BICYCLES WITH SIDECARS.

Classes F (350 c.c.) and G (500 c.c.) have been abolished, and are substituted by

Class.	C.C.	Min. Weight, without Oil or Fuel, in Kilos.		Min. Size of Tyres. Cover and Tube Separate and Detachable.	
		Now.	Formerly.	Now.	Formerly.
				mm.	mm.
F.	600	125	110 (750c.c. class)	65	60
G.	1,000	160	120	75	65.

DIVISION III.—CYCLE CARS. (All three or four-wheeled motor vehicles other than motor bicycles with sidecars, carrying one or two persons, and of maximum weight without fuel, oil, or water, of *406*, instead of 300, kilogs.) Class J (750 c.c.) has been abolished.

Class.	C.C.	Min. Weight, without Oil or Fuel, in Kilos.		Min. Size of Tyres. Cover and Tube Separate and Detachable.	
		Now.	Formerly.	Now.	Formerly.
				mm.	mm.
I.	1,100	250	175	75	60

Article 7 now reads as follows (the additions are in italics): "All vehicles in Division II. must be constructed to carry two persons. Both seats must be occupied in *all open races, open reliability trials, attempts on records, and other open competitions.* The minimum weight of any driver or passenger carried by either a motor bicycle or any other class of vehicle is uniformly fixed at 60 kilogs. This weight *must* be made up, if necessary, by ballast."

EQUIPMENT ARTICLE 8.

DIVISION I.—For all *open road races over one mile*, motor bicycles must be equipped as follows:
Two brakes working independently.
(One toolbag—deleted.)
Efficient mudguards, projecting beyond the tyre at least 10 mm. each side, etc., etc.
One saddle (or seat—deleted).
One stand.
One efficient silencer: the use of a free exhaust is permitted in speed trials *only*. The following rule was proposed by the Swiss M.C. Union and adopted: "*The silencer consisting of pipes with or without expansion chamber must have a volume of the exhaust piping from the cylinder flange to the outlet of the pipe at least one-fifth of the total of the piston area of the engine.*"
The exhaust gases must not be so directed as to raise the dust.
Uncovered exhaust ports in the cylinder walls are forbidden.
In reliability trials the motor bicycles engaged must be genuine touring machines equipped accordingly.
In addition to the above equipment, they must also be furnished with one carrier, *to be capable of carrying not less than 50 kilogs.* (about 1 cwt.); one or more fuel tanks of a minimum total capacity of 5 litres; one or more oil tanks of a minimum total capacity of 1 litre; *one front wheel stand.*
DIVISIONS 2 and 3.—For all *open road races exceeding one mile* motor bicycles with either three or four wheels must be equipped as above, except as regards stands.
In the case of motor bicycles with three or four wheels, the stand may be substituted by a jack.
ARTICLE 10.—In road races under one mile, and all races on tracks, the classification rules must be adhered to. As regards equipment, machines must be fitted with two independent brakes. The governing body of the sport in each country is authorised to make its own regulations as regards these events.

These rules are binding upon all promoters of motor cycle competitions as from the first day of January, 1921.

International Six Days to be in Switzerland.

With regard to the rules governing the making of records, it was proposed by Switzerland that all kilometre and mile records up to *five kilometres or three miles* should be accomplished in both directions, the mean speed of both attempts to be the official result of the trial; both attempts to be run inside one hour, *during which the machines must not be altered in any way.* This applies to all record trials on the road, Brooklands, or any other tracks.

Rules for Record Attempts.

Great Britain (The Auto Cycle Union) proposed :

1. That the following distances or periods only be recognised for world's records: Flying start, 1 km. and 1 mile (Record to be the mean of the two times taken to traverse the specified distance, once in each direction of the same course; attempts to be made within a period of ten minutes from the start to finish of the second run), 5 km., and 5 miles; standing start, 10 km., 10 miles, 50 km., 50 miles, 100 km., 100 miles, 200 km., 200 miles, 1, 2, 3, 4, 5, 6, 12, and 24 hours.
2. All attempts at world's records must be made on a motor cycle having an engine the cylinder capacity of which must not exceed the maximum capacity permissible under the rules of the International Federation. *All publicity with regard to records must state the class in which the record was made.*

These rules, with the amendments and alterations in italics, were subsequently passed at the meeting of the congress.

At the conclusion of the sub-committee those present at the congress were invited to lunch by the Automobile Club of France, where the meetings were held. The affair was a very informal one, but a short speech welcoming the delegates was made by the chairman, M. René de Knyff, who had just returned from having followed the Grenoble trial on a 3½ h.p. Douglas. Naturally, he deplored the meagre entry, but stated that he was well aware of the difficulties with which manufacturers had to contend.

A Representative Gathering.

The congress proper met at 3 p.m. There were present M. René de Knyff (president of the French Motor Cycle Union) in the chair, Messrs. G. Longuemare (France), Ch. Fourreau (secretary of the U.M.F.), Jules Neher (Switzerland), Graeme Fenton (France), G. de Ro, M. Fagard, and A. Michant (Belgium), E. M. P. Boileau (England), and T. W. Loughborough (secretary of the F.I.C.M.). These attended unofficially and without the right to vote : O. L. de Lissa (England) and Signor Enrico Peila (Italy). Messages of regret at not being able to attend were received from the Hon. Sir Arthur Stanley, G.B.E., M.V.O., M.P., and from various delegates who could not be present. Mr. W. H. Wells (U.S.A.) could not attend, having arrived in London without his passport, while the Italian representative wired that he had missed the connection at a junction *en route*. Representatives from Holland who were expected did not turn up.

International Trial Results.

The chief business transacted at the meeting has already been dealt with, and it only remains to say that the proposals as regards the rules put forward by the sub-committee were adopted. In the course of the proceedings, which were held under the chairmanship of M. R. de Knyff, M. Longuemare, a vice-president of the Federation, announced briefly the results of the Six Days Trials at Grenoble. Of fifteen starters twelve had finished, and of these eight had lost no marks. The special prize offered by the Touring Club de France had been won by Gex (Motosacoche), and the Swiss team had won the International Cup.

In reply, M. Neher said he felt deeply honoured at the confidence placed by the meeting in the Swiss Motor Cycle Union in deciding to hold next year's international trial in Switzerland, and thanked the promoters of this year's trial for its splendid organisation. It had been a difficult one for the competitors, who had suffered intense cold on the higher passes, and had had frequent difficulties as regards carburation.

Automatic Timing Devices.

Following on M. Neher's report of the morning's sub-committee meeting came a long discussion on the proposal made by the representatives of France that automatic timing be considered for recording attempts at records. In Switzerland competitors are timed by the machine touching a cord which actuates the watch. The Chairman inferred that this method was not so accurate as that by General Sir Capel Holden's apparatus used by the B.A.R.C. and the A.C.F. The proposal, however, was finally accepted after it had been agreed to employ watches with $\frac{1}{10}$ sec. divisions. The proceedings terminated at 6 p.m.

The December Congress in Brussels.

The next meeting of the Federation is to be held in Brussels during the second fortnight in December, the time the Brussels Automobile Show will be held.

A POPULAR INTERNATIONAL TRIAL.

The contest, between amateur and trade teams of England *v.* Holland, was run off last week (see page 197). Above are depicted some members of the English team at Harwich, *en route* for the Continent.

THE DEGORY "NO-JET" CARBURETTER.

A Single Lever Instrument of Extremely Simple Construction.

THE Degory carburetter, like many excellent inventions, is delightfully simple. It is correctly called the "No-jet" carburetter, as there is certainly no jet proper. The petrol flows through a channel, the entrance of which is some distance from the bottom of the float chamber, so that it cannot be obstructed by foreign matter, not excluding water, and enters a ring in which there are two holes—one in the centre leading to the main petrol supply and a small one at the side leading to the bypass. The main flow of petrol passes round the ring surrounding the exterior of the choke tube, and in this ring are numerous small holes arranged radially through which the petrol issues in a fine stream, and becomes vapour before entering the inlet pipe.

When starting with the throttle very slightly open the suction of the engine draws a small quantity of air very rapidly between the throttle and the channel leading to a bypass, the entrance to which is in the float chamber and situated above the main fuel supply. A further supply of air enters an orifice between the float chamber and the vaporising portion of the carburetter, and a perfect mixture is formed at the point where the air enters. The result is that a very small quantity of mixture is admitted, which allows the engine just to turn over.

Providing for Pick-up.

The air current passing through the choke tube is not sufficiently strong to create a vacuum in the chamber round the choke tube, but a certain amount of fuel is accumulated there, and when the throttle is gradually opened the suction in the bypass channel ceases, but increases automatically in the choke tube owing to the increased velocity of the air entering. Owing to the collection of petrol in the chamber round the choke tube when the throttle is partially closed a certain amount of reserve is formed so that when a sudden acceleration is required there is plenty of petrol available to meet the demand.
